'Now, then, young gentlemen, choose your partners!' Mr Plantagenet murmured, with a bland and inane smile. ('Strike up the violin, Maud!' aside.) 'Bow, and fall into places. Eight bars before beginning. No, *not* yet, Miss Tradescant.—Explain to this young lady, *if* you please, Miss Tudor, that she must always wait eight bars—eight bars exactly—before she begins to *chasser*.—That's right. Just so! Advance in couples—right, left—right, left—right, left—down the middle.—Very nicely done, indeed: very nicely: very nicely. Now!—yes—that's it. Change hands, and over again!'

A year and more had passed, and Mr Plantagenet's face bore distinct signs than ever of his ruling passion. It was coarse and red under the bland exterior. Maud watched him intently now on the morning of lesson days to see he didn't slink away unobserved into the bar of the *White Horse* before the appointed hour for the meeting in the Assembly Rooms. Once let him cross the threshold of the inn, except to enter the big hall where he received his pupils, and all was up with him. On such occasions, Maud was compelled with grief and shame to stick a notice on the door: 'Mr Plantagenet is indisposed to-day, and will be unable to meet his usual classes.' Nobody else ever knew what agony those notices cost the poor shrinking girl: but on the next appointed afternoon, Mr Plantagenet would be at his place again as if nothing had happened, and would murmur plaintively, with one hand on his left breast, and the other

on the bow of his faithful violin: 'My old complaint, ladies and gentlemen; my old complaint! I suffer so much from my heart. I regret I was unable to receive you on Wednesday.' Everybody in Chiddingwick knew quite well the real nature of Mr Plantagenet's 'old complaint'; but he was an institution of the place; and everybody pretended to believe in it and to sympathise with him.

On this particular day, however, in the middle of November, Mr Plantagenet seemed even more consequential and more dignified than usual, if such a thing were possible. He received Lady Agatha's little girls with princely condescension. Maud, who stood by trembling, and watching him with dismay, as he fiddled with a will on his well-tried violin, wondered to herself, with a mute feeling of terror in her heart, what on earth could have put her father into such visible good-humour. She didn't discover the secret till the end of the lesson. Then Mr Plantagenet, rising with great importance and a conscious smirk, observed in his suavest and most professional tone: 'I'm sorry to say, young ladies and gentlemen—and you, Miss Tudor—I won't be able to give the usual lessons next Tuesday and Wednesday. The fact of the matter is, I shall be away from Chiddingwick. It doesn't often happen that I take a holiday; but on this occasion I shall be away from Chiddingwick. Long and close attention to the duties of a harassing and wearisome task has undermined my constitution; you can sympathise with my feelings: and next week, I propose to give myself a well-earned repose, in order to visit my dear son at the university of Oxford.'

It was a perfect bombshell. To Maud, sitting by wearily, with her small violin clasped in her bloodless hands, the announcement came like a thunderbolt: he was going to Oxford! She turned deadly pale at once, and clutched the bow of her instrument with a spasmodic action. Mary Tudor, sitting near, noticed the pallor on her cheek, and guessed the cause of it instantly. The two girls looked up: for a second their eyes met; then Maud let hers drop suddenly. Though on that one dearest point Dick had never taken her into his confidence, Maud had guessed the whole truth during last Christmas vacation; and if anything could make the cup of her bitterness even bitterer than it was, 'twas the thought that Dick's friend, Dick's future wife perhaps, should see and understand the full depths of her misery.

Mary had tact enough and feeling enough, however, not to press her sympathy upon the poor wounded creature. With a hasty side-glance, she hurried her charges out of the room as quick as she could, and motioned to the other governesses to do the same for theirs with all possible expedition. Two minutes later, the big hall was fairly cleared, and father and daughter stood face to face in silence.

If Maud had followed only the prompting of her own personal feelings she would have sat down where she was, covered her face with her hands, and cried long and bitterly.

But her sense of duty towards her father prevented her from so giving way; she couldn't bear to let him see how deeply, for Dick's sake, she dreaded the idea of his going to Oxford. All

* Copyright 1892 in the United States of America by the Cassell Publishing Company.

she could do was to look up at him with a scared white face, and murmur in a terrified half-articulate tone: 'Oh, father, father, you never told me of this. What on earth do you mean by it?'

Mr Plantagenet eyed his daughter askance out of the corner of his eyes. He was more afraid of Maud than of any one else on earth; in point of fact, she was his domestic keeper. But he tried to assume his jaunty happy-go-lucky air for all that. 'Well, my dear,' he said, examining the strings of his fiddle with profound attention, 'I haven't had a holiday for a very long time, away from Chiddingwick; and I'm tired with the duties—the duties of my very exacting profession—and I felt I needed a change; and I haven't been up to Oxford since your brother Richard entered into residence as a member of the university. Now, I naturally feel a desire to see my son in that position in life which a Plantagenet ought to occupy. And so, the long and the short of it is'—Mr Plantagenet went on, shuffling about, and glancing up at her anxiously—'the long and the short of it is, as you heard me inform my class just now—I think next week of allowing myself the luxury of a trip to Oxford.'

Maud rose and seized his arm. His grandeur and indefiniteness positively alarmed her. Did he think she would be taken in by such grandiose words? 'Now, father,' she said boldly, 'that sort of talk won't do between us two, you know, at a serious crisis. This is important, very. You must tell me quite plainly what you mean by it all. Does Dick know you're coming, and why do you want to go to him?'

Mr Plantagenet, thus attacked, produced from his pocket a rather dirty silk handkerchief and began to whimper. 'Has it come to this, then?' he cried with theatrical pathos—'has it come to this, I ask you, that I, the Head of all the Plantagenets, have to beg leave and make explanations to my own eldest daughter before I can go to visit my own son at Oxford?' And he hid his face in the pocket-handkerchief with a studied burst of emotion.

But Maud was inexorable. Dick's happiness was at stake. Not for worlds, if she could help it, would she have him shamed by the appearance before all the world of Oxford of that shabby, degraded, disreputable old man in the guise of his father. 'We must be practical,' she said coldly, taking no notice of his hysterics. 'You must explain what this means. I want to know all about it. How have you got money to go up to Oxford with; and all those bills unpaid; and Mrs Waite still dunning us for the rent from last quarter? And where are you going to stop? And does Richard know you're coming? And have you proper things to go in? Why, I should think the very pride of a Plantagenet ought to prevent you from going to a place where your son lives like a gentleman, as he is, unless you can afford to go in such clothes as won't disgrace him!'

Thus put upon his mettle, Mr Plantagenet, deeply moved, at first admitted by slow degrees that he had taken proper steps to replenish his wardrobe for this important occasion. He had ordered a suit of good clothes, very good clothes, at Wilkins's. And they would be paid for too,

the Head of the House added proudly. Oh, he wasn't quite so devoid of friends and resources in his old age as his undutiful daughter appeared to imagine. He could sometimes do a thing or two on his own account without asking her assistance. He had money in hand—loads—plenty of money for the journey!

The more high-flown and enigmatical Mr Plantagenet grew, the more terribly was poor Maud distressed and frightened. At last she could stand it no longer. Plantagenet though she was, and as proud as Heaven makes them, she couldn't prevent the tears from stealing through and betraying her. She flung herself into a chair and hid her face in her hands. 'Now, father,' she said simply, giving way at last, 'you must tell me what you mean by it. You must explain the whole thing. Where did you get this money?'

Then, bit by bit, hard pressed, Mr Plantagenet admitted, with many magnificent disclaimers and curious salves to his offended dignity, how he had become seised of a sum of unexpected magnitude. When he took the last rent of the Assembly Rooms, for the afternoon dancing lessons, to the landlord of the *White Horse*, a fortnight earlier, the landlord had given him a receipt in full, and then, to his great surprise, had handed him back the money. 'You've been an old customer to me, Mr Plantagenet,' Barnes had said—'with real feeling, my dear—I assure you, with very real feeling'—'and a good customer, too, and a customer one could reckon upon, both for the Rooms and the parlour; and I feel, sir, now your son's gone up to Oxford College, and you a gentleman born, and so brought up, in the manner of speaking, it 'ud be a comfort to you, and a comfort to him, if you was to go up and see him. This 'ere little matter of the quarter's rent ain't nothing to me: you've brought me in as much and more in your time, as I says to my missus, with your conversational faculties. It draws people to the house, that it do, when they know there's a gent there of your conversational faculties.' So in the end, Mr Plantagenet, after some decent parley, had accepted the gift, 'in the spirit in which it was offered, my dear; in the spirit in which it was offered;' and had resolved to apply it to the purpose which the donor indicated, as a means of paying a visit to Richard at Oxford.

Poor Maud! she sat there heart-broken. She didn't know what to do. Pure filial feeling made her shrink from acknowledging even to her own wounded soul how ashamed she was of her father; far more did it prevent her from letting the poor broken old drunkard himself too plainly perceive it. All she could do was to sit there in blank despair, her hands folded before her, and reflect how all the care and pains she had taken to keep the rent-money sacred from his itching hands had only resulted at last in this supreme discomfiture. It was terrible, terrible! And Dick, she knew, had had social difficulties to contend with at Oxford at first, and was now just overcoming them, and beginning to be recognised as odd, very odd, but a decent sort of fellow. Mr Plantagenet's visit would put an end to all that. He couldn't be kept sober for three days at a stretch; and he would disgrace dear Dick before the whole university.

However, Maud saw at once remonstrance was impossible. All she could conceivably do was to warn Dick beforehand. Forewarned is forearmed. She must warn Dick beforehand. Sorrowfully she went off by herself towards the post-office in the High Street. She would send a telegram. And then, even as she thought it, the idea came over her, how could she ever allow that fuzzy-headed Miss Janson at the Chiddingwick office to suspect the depth of the family disgrace? and another plan suggested itself. The third-class fare to Broughton, the next town of any size, was eightpence-halfpenny return: telegram would be sixpence; one and twopence-halfpenny in all: that was a lot of money! But still, for Dick's sake, she must venture upon the extravagance. With a beating heart in her breast, she hurried down to the station and took a ticket for Broughton. All the way there she was occupied in making up a telegram that should not compromise Richard; for she imagined to herself that a scholar of Durham would be a public personage of such distinction at Oxford that the telegraph clerks would be sure to note and retail whatever was said to him. At last, after infinite trials, she succeeded in satisfying herself. 'PLANTAGENET; Durham College, Oxford.—E. P. visits Oxford to-morrow as surprise. Take precautions.—MAUD.' That came to sevenpence. But try as she would, she couldn't make it any shorter. Not for worlds would she describe E. P.'s relationship to the Scholar of Durham. And she blushed to herself as she handed it in to think she should have to take the brother of whom she was so proud to take precautions against a visit from their own father!

INSECT WAX.

THOSE who, like the present writer, have had experience of trade in the East, often puzzle over the origin, character, and destination of many strange items of commerce unknown in the Western world. One of the strangest of these oddities of traffic is the White Wax of China; and naturalists have only recently been able to reveal it as also one of the strangest products of Nature. The existence of the commodity and of the Chinese business in it has, however, been known to Eastern traders for a couple of centuries.

As long ago as 1655, Martini mentioned *Albaceres* among the products of the Hu-kwang provinces; and since then, White Wax has been repeatedly referred to by travellers in China. But very little was really known about it until the Shanghai Chamber of Commerce and the Director of the Kew Gardens began to interest themselves in the subject. Some years ago, Mr E. Colborne Baber, Chinese Secretary of the British Legation at Peking, wrote a special Report about Insect White Wax, on his return from a journey of exploration in Western China (the records of which are buried in Blue-books and in the Papers of the Royal Geographical Society). In consequence of the information thus brought to light, Mr Alexander Hosie, of the Consular service in China, was instructed to make a special visit to the White Wax country, to gather additional information on the whole subject of wax

production, and to obtain for Sir Joseph Hooker specimens of the insects, of the trees on which they live, of the wax itself, and of the articles into which the Chinese convert it. And still more recently, the American Minister at Peking has made it the subject of a special Report to his Government.

Mr Denby, by the way, refers to an item on the Chinese Customs' lists which has often puzzled the coast-traders, namely, tigers' bones. One lot of thirteen thousand pounds weight of these bones was entered of the declared value of six hundred pounds—say, roughly, about one hundred pounds per ton. At such a price they cannot be used as manure; for what purpose, then, are they exported from Ichang? To convert into a tonic which fetches a high price, as it is supposed to impart to the invalid some of the strength of the tiger! Almost as high a price is put upon deer-horns, which are supposed to possess exceptional medicinal properties of another kind.

Of White Wax upwards of a million and a half pounds were shipped at Ichang in 1889, and sent in foreign vessels down the Yang-tse river for distribution at the Chinese ports. The value of this mass was stated at about ninety-five thousand pounds sterling. In Shanghai a ton of this wax in its commercial state sells now for about two hundred pounds. Being a clear white wax which only melts at a high temperature—one hundred and sixty degrees Fahrenheit—it is found extremely useful as a coating for candles, to prevent too rapid consumption. It is also used for sizing paper and cotton cloths, as a glaze for silk, and as a polish for furniture and stone ornaments. Besides the quantity just stated as having been shipped down the Yang-tse in foreign vessels, an immense quantity is sent up the river in native junks to the cities of the interior; and a further quantity finds its way across the mountains and down the West River to Canton. In the Canton 'go-downs' the large round white cakes are a familiar sight.

Where, then, does it come from? Largely from what Mr Colborne Baber describes as the richest nook in China—the neighbourhood of the sacred mountain of O-mi or O. As a matter of fact the White Wax is found in at least five of the great western provinces; but the chief area of production is in the province of Se-chuen, in the Valley of Chieu-chang, which is formed by the river An-ning as it makes its way towards the Yang-tse, there called the Golden River. The precise geographical position of the valley of Chieu-chang is between latitude 29° 20' and latitude 27° 11', and it is about five thousand feet above the level of the sea.

In this valley and on the slopes of the surrounding hills grow in greatest profusion what is locally called Chung-shu, or the Insect Tree, which elsewhere is called the Evergreen Tree and also the Crackling-flea Tree, because of the spluttering and popping of the branches when burning. It is an evergreen with thick, dark-green, glossy, ovate and pointed leaves, which spring in pairs from the branches. In May and June it bears clusters of small white flowers, and, later, a dark purple fruit. At Kew it has been identified as a large-leaved privet (*Ligustrum lucidum*).

These trees afford the birthplace and cradle of the wax insect, scientifically called *Coccus pe-la*. In the early spring the bark of the boughs and twigs becomes covered with brown pea-shaped scales, which can be easily detached, and which when opened reveal a flowery-looking mass of minute animals, whose movements can just be detected by the naked eye. In May and June, however, the scales are found to contain a swarm of brown creatures with six legs and two antennae each. Some of the scales also contain the white bag, or cocoon, of a small black beetle, which, if left undisturbed, burrows into and consumes the scales. The Chinese say that this beetle eats the little wax insects; and it appears certainly the case that where the parasite is most abundant the scales fetch a lower price in the first market.

This first market is one of the most curious incidents in a curious history. The valley of Chieu-chang produces the insects, but the wax is produced elsewhere. At the proper season the scales are detached from the *ligustrum*, and made up into paper packets of about sixteen ounces each. A porter's load is about sixty of these packages, and the duty of the porters is to convey them with the utmost speed over the mountains, a distance of two hundred miles, to the town of Chiä-ting, which is the centre of the wax-producing country. The greatest care has to be taken in the carriage of the brittle scales, and the porters must only travel during the night, as the high temperature during the day will develop the insects too rapidly, and they may escape from their natural cages. Wherever they stop for rest, the porters must open up their paper-packets and spread them in cool places; but with all precautions, there is a large percentage of loss upon the journey—the packets usually weighing at Chiä-ting each about one ounce lighter than when they left Chieu-chang. The usual price at Chiä-ting for a pound of scales is about half-a-crown; but in years of scarcity this price has been doubled. A pound of scales ought to produce from four to five pounds of wax; but in bad years only pound for pound is yielded, so that the profits of the industry are very fluctuating.

Between Chiä-ting and the sacred O-mi mountain—which has so often been described by travellers—is a plain, which Mr Hosie describes as an immense rice-field, well watered by the streams from the western mountains. This plain is thickly studded with tree-stumps, from three to twelve feet high, resembling pollard willows. This tree does not seem as yet to have been accurately classified, but it is a species of ash, called by the Chinese Pai-la-shu, or the 'White-wax tree.' It is to these wax-trees that the scales are brought from the insect-trees of Chieu-chang.

The scales arrive in May, and are immediately reweighed and made up into fresh packets, each packet containing twenty to thirty scales, enclosed in a leaf of the wood-oil tree. The edges of the covering are drawn together with a rice-straw, by which also the packet is suspended under the branches of the wax-tree. Then a few small holes are pricked in the packets, so that the insects can find their way out on to the branches of their new habitation.

In due time the insects emerge, and very soon make their way to the leaves which have been

allowed to sprout about the tops of the pollards. They remain among the foliage for thirteen days, and then descend again to the branches and twigs, where the females proceed to make scales for the deposit of their eggs, and the males to excrete the white wax. What connection exists between the two operations is not very certain; for while it is believed that the wax is intended as a protection for the scales, Mr Hosie says he has frequently seen deposits of scales far removed from any white wax.

What the insects feed on is also something of a mystery. For thirteen days, as we have seen, after emerging from their shelters they nestle among the leaves; but all the rest of their time they spend upon the bark of the tree. Whether they feed upon the leaf or upon the sap cannot be said, because no visible mark of insect ravages can be detected on either. The Chinese say that they live upon dew, and that the wax is a kind of insect perspiration!

There are, however, two classes of the insect, distinguished by the Chinese as La-sha, or 'wax sand,' and Huang-sha, or 'brown sand.' The former produces wax, and the latter does not. It is assumed, then, that the La-sha, which are of a reddish-white colour, are the males; and that the Huang-sha, which are of a brownish colour, are the females.

Soon after the insects come down from the green heights, the inner sides of the boughs and twigs, their new resting-places, begin to show a thin white coating, like snow. This gradually spreads over the whole bough, and in the course of about three months should have attained a thickness of a quarter of an inch.

One hundred days is the usual period allowed for the completion of the deposit, and each day during the process the wax-farmer makes the round of the trees under his care, thumping them with a heavy stick, in order to destroy the beetles, which he calls la-kow, or wax-dogs, and regards as the natural enemy of the wax insect.

When the hundred days are expired, the branches are carefully lopped off, and after as much of the wax as possible has been peeled off by hand, the branches are placed in pots of boiling water. The wax melts, rises to the surface, is skimmed off, and moulded. The boiling of the branches, however, produces a darker and inferior wax to that which is removed by the hand. The first hand-gleanings are also thrown into boiling water to be melted, and then skimmed into round moulds, which form the compact round white cakes one sees at Shanghai or Canton.

There is still a third process. After the trees have been stripped of every atom of wax, and every bit of available twig has been boiled, the poor insects, who have meantime fallen as sediment to the bottom of the pot, are then placed in a bag, and squeezed until they yield every atom of wax they may have left in their bodies. The pigs finish what is left of the pilgrims from far Chieu-chang.

The process, nevertheless, is a wasteful one, because the fresh scales which would produce a new generation of insects are destroyed when the branches are boiled. This is why Chiä-ting has to send every year to Chieu-chang for a fresh supply of eggs and insects. Then, again, after

the branches have been lopped off a wax-tree, it cannot be used again for three years—a period of rest which has been found necessary to allow it to recover vigour and foliage. One reason for this period is that sprouts of one or two years' growth are too weak to resist a strong gale, and the Chinese will not risk their precious scales on branches which may be blown or washed away.

What would happen if the wax-tree were left undisturbed? This may be guessed from the following experience of Mr Hosie's: 'On the 27th of August 1884,' he says, 'branches of the *ligustrum*, coated with wax, were brought to me. On removing the wax I found close to the bark a number of minute brown bags, evidently the male *cocci* in a state of metamorphosis. I examined the undisturbed branches from day to day, and on the 4th of September I observed quite a number of white hair-like substances rising above the surface of the wax deposit. These ultimately proved to be the white forked tails of the male insects forcing their way up from the bark, and dislodging, as they emerged, small quantities of the wax. They were now provided with long wings, and after tarrying for a time on the branches, flew away. By the 13th of September they had all disappeared, leaving visible the tunnels from the bark upwards by which they had escaped.'

Needless to say the Chinese permit neither the development of the wings nor the escape!

Only a few years ago as many as ten thousand porters annually were required to transport the packets of scales from the Valley of Chieu-chang to Chiä-ting. One of the sights of the road in the season is still a stream of carriers with long round baskets slung at the end of poles, with a lamp swinging in front. The rate at which these men have to travel, and mostly, as has been said, by night, has been often commented on by travellers, who did not altogether understand the nature of the business they represented. On their way to Chiä-ting the carriers have to cross the Ta-tu river with their precious loads, and towards the end of April the race to the ferry is one of tremendous excitement. Hundreds of men will be competing day by day who shall reach the boat first, for delay is injurious to the precious charge they carry, and the fleetest of foot will bring his freight more safely because more quickly to its destination.

This flight of insect carriers, however, is not now so great and so exciting as it was. Mr Hosie says that a thousand porters per annum will now carry the Chieu-chang supply, instead of ten thousand, as formerly. This seems in part due to the development of the industry in other provinces, but chiefly to the fact that American kerosene is largely displacing the use of candles—of vegetable or animal tallow coated with insect wax—in Chinese households. The present value, also, is only about one-half of the value ten or fifteen years ago.

It would thus seem that the natural oil-wells of America are gradually 'playing out' one of the most curious natural industries in the land of curiosities—China. But insect White Wax is too useful a commodity, and has too many valuable properties, to be dropped out of sight altogether. Without doubt, large employment can be found for it in Europe, where even now it

is not unknown, when it reaches a suitable level of price. A few years ago an attempt was made to introduce the Wax Insect into Algiers, but we have not learned with what result.

In conclusion, it may be mentioned that Se-chuen—the great silk-producing province—has other natural curiosities besides the wax insect. There is, for instance, the Varnish Tree (*Rhus vernicifera*), which in the hilly districts grows to a height of twenty feet, and yields, by incision of the bark near the foot of the tree, a sticky sap, which forms an excellent varnish. It is dark brown as exuded, and becomes jet black by exposure to the air; and it is good both for cementing and varnishing. It has been suggested that if chemical science were applied to make this varnish colourless, it would become an important item of Chinese trade.

Again, there is 'Soy,' which some people used to shudder at as made of boiled cockroaches, but which is really the juice of a bean. But as our object was to tell of wax insects and insect wax—not of hypothetical cockroaches—we must draw the line.

BABY JOHN.*

CHAPTER IV.—SPRING.

When daisies pied and violets blue,
And lady smocks all silver white,
And cuckoo buds of yellow hue
Do paint the meadows with delight.

SHAKESPEARE.

How beautiful that spring was! 'It's just perfect,' Alice used to say, standing on the beach, looking out over such a sunny sea, bright and sparkling, blue and green and peacock, with great indigo shadows from those fleecy white clouds which passed across the blue sky; or pale, shimmering, dimpling silver, with tiny, rippling waves chasing each other to the shore; or rough, tumbling, gray-green with white-crested breakers, coming proudly riding in, and casting themselves on the beach, and dragging back the pebbles with them with a screaming rush.

'Bless the girl!' Lucy used to complain to baby, 'she's never tired of staring at that old sea. She don't take no notice of you and me, as if you wasn't better to look at any day!' Though she herself was not far behind Alice in her fascinated love of it.

But there was not only the sea, but the inland delights of the spring, which were new to Alice, whose lines had always been cast in towns, and whose days had been too full of work since she was old enough to do half-time at the mill, to allow of exploring into the country round, which every year grew farther away as the town spread out its octopus-like arms of brick, spoiling the hedgerows, and swallowing up the trees and open spaces, and annihilating the primroses. In every direction behind Beston, deep lanes with high banks led away, and there were copses with no notice boards that trespassers would be prosecuted, and meadows that were not desirable building lots; and in these deep sheltered lanes, primroses grew as plentifully and beautifully as

* Copyright 1892 in the United States of America by Roberts Brothers.

in the first spring in Eden; and in the copses, bluebells and dainty white anemones were in such lavish abundance, that Alice longed for a regiment of the little ones from the alleys of Felsby, 'as might gather them all day, and you'd hardly see the difference.'

Then came the cowslips all over the meadows, and kingcups by the stream; and the girls came back every day laden with flowers, or with shells and bright-coloured pebbles, or ribbons of seaweed from the beach, till the kind, deaf, old landlady entered a protest against the accumulation of such rubbish; and Alice reluctantly agreed to some of the larger stones being thrown away, as there was no denying that they looked very much the same as the other many thousand stones on the beach, now that they no longer lay in the wash of the coming tide, and had to be rescued by a bold dash at the risk of a drenching.

Their lodgings were of quite a humble description, as they soon moved away from those which Mr Craddock had engaged for them, and which, though by no means grand, made the girls feel constrained and ill at ease; and they found a cottage on the outskirts of the little place, the main recommendation to which was that the old woman standing at the gate one day noticed the baby, and declared it to be 'the finest child for its age that ever she seed.'

A woman of such discrimination was likely to be satisfactory in other respects; so when they saw a modest card in her parlour window with 'Lodgings to let' on it (she did not even call them apartments), they went in, and found a clean little sitting-room and bedroom over it, and the terms very moderate, as the season (for even little Beston has a season) had not begun, and Mrs Tripp had hardly hoped to let her rooms for two months to come. Mrs Tripp kept no servant, and was rather deaf; but the girls declared it was so much the better, as she had no objection to little cookings over the parlour fire, which in the other lodgings had been sternly discountenanced, or to their stepping into the kitchen for anything they wanted; and her deafness prevented any annoyance from the baby's crying, for even the most perfect baby will cry sometimes.

She was rather confused in her mind as to which was the mother of the baby; and as Alice, by virtue of her superior age and the old traditions of her relations with Lucy, took the lead and management, Mrs Tripp, as a rule, called her 'mum,' and Lucy 'my dear,' and the girls for fun rather favoured the idea; and, as Lucy recovered her health and spirits, she looked so young and girlish, that it was much easier to imagine Alice, with her more staid and quiet manner, to be the married woman and mother; and as the baby was quite as often in her arms as in Lucy's, it was no wonder that Mrs Tripp was confused.

'Ain't it lovely?' Alice used to say over and over again, the first few days they were there; 'it's just too good! Whoever would have thought, when we was at work in the old mill, with all the row, and the dust, and the heat, and the worry of getting through, that this was going on all the time and we should see it at last? I'm that glad to have seen it all. I shall think of it times and times, and when I goes back'—

But here Lucy always stopped her mouth with a kiss or baby's little hand, and would not let her talk of that terrible future. 'I don't think I'd ever a notion what heaven was like before,' Alice said. 'I've tried sometimes to fancy it, but the nearest I come to it was them gardens up Castle Hill with red geraniums and a fountain, and I don't think I'd turn my head now to look at 'em, leave alone jumping to see over the wall. Ain't it lovely to wake up in the morning and know as it's all there, and nothing to do but enjoy it? One won't feel so strange-like in heaven now. I used to be afraid of that sometimes when I got thinking, for I knew that heaven was bound to be different from Felsby anyhow.'

Alice would wax quite eloquent over the delights of Beston, till Lucy would turn and laugh at her. 'You are a funny girl, Alice! I do believe the sea and the flowers and things is instead of meat and drink to you. You don't eat nothing hardly, and I don't believe you sleeps much neither; for first you're out of bed to look at the moon on the sea, and then you thinks the sun'll be rising, and you must have a peep. And you ain't no flesh on your bones; I could carry you pretty near as easy as I can baby. There'll be nothing of you if you go on this way, and it'll be my turn to nurse you up as you've done me.'

One day they took the baby to be christened. There had been some talk of its being done before they left Felsby; but the weather had been bad, and the question of sponsors a difficult one, for Mr Craddock had naturally wished that his mother should hold the baby at the font, and Lucy, though she did not say so, was resolved that Alice should be his god-mother. So the subject was dropped, and Lucy had now written to ask her husband if he would mind the baby being 'done' at Beston, and whether he had any choice about the name. It was a work of much time and difficulty getting that letter written, for Lucy was not a good scribe, and she was keenly conscious all through of the critical eye that would observe the bad writing and worse spelling. Alice was no great help either, and she did not understand Lucy's feverish wish to send a tidy-looking letter, but was inclined to think that a blot here and there smeared out with the little finger did not matter.

That letter spoilt the whole of one day, and even bid fair to spoil the night that succeeded it; for long after they were in bed Alice found Lucy wide awake, with hot cheeks and bright eyes, agonising herself over some word which she was sure was spelt wrong.

'Do he make fun of your spelling now?' Alice asked.

'No, he don't say nothing. I wish he did, but he looks kind of patient. I shan't never forget as pudding is spelt with two *ds*, from the look he gave when I wrote it down with one on the cook's slate.'

It is certainly a comfort in this age of inventions that the art of sending looks by post has not been discovered, though perhaps unhappy generations to come may invent a means of conveying them in that way; and if Mr Craddock looked patient or shuddered over his wife's letter, it was only known to himself, for the answer

only said that she could have the baby baptised at Beston if she liked, and might give it what name she pleased.

Alice could not at all account for Lucy's wrath on reading this letter, which was thrown across the table for her inspection. It was stiff perhaps, and business-like; but it was not till Lucy caught up the insulted baby out of the cradle and declared he was mother's own little boy, and shouldn't be called 'it,' like a stick or a stone, that he shouldn't! that she realised the cause of offence.

'What shall you call him?'

'Yes, what shall it be? There! I'd almost wish he were a girl, so as we could call him Alice Lucy, or Lucy Alice, after us two. We'll choose just the names as we like best; you shall choose one, and I'll choose another, and then we'll have a third to please us both, for three names ain't a bit too much; folks often has three names, and some of them royal babies have ever so many more, and long ones too. I've a kind of fancy for Reginald. Don't you remember that story in the *Family Herald* as we used to read in Partley's shop, and how we couldn't see over the page just at the most interesting part where the wicked earl had hold of the lady by the hair of her head, and Sir Reginald came rushing in? And you used to have a liking for Arthur. And there's Lancelot too. I suppose it wouldn't do to give him more than three, as he ain't royal, though he's every bit as good as any king or prince of them.'

They talked for hours of what the name should be, and strung together all manner of fine-sounding incongruous names, and wrote them down—not always, I am afraid, quite correctly spelt—to see how they looked, or repeated them to the baby to see if he showed any signs of preference; and finally abandoned the name of Lancelot on account of his crying when it was mentioned, though Alice was not sure that a touch of stomach-ache might not have been the cause of this demonstration.

It was after they were in bed at night, and the baby making comfortable, little, drowsy noises in the bassinette on Alice's side of the bed—for they took it by turns to have the supreme honour of having the baby next them—that Alice asked, 'What's his name?'

'His? Oh! John. Why?'

'Oh, nothing. Only John?'

'Yes, just John alone. I can't think whatever his mother could have been about. It's downright common, ain't it?'

'Perhaps his father's name were that?'

'Yes, it were. I've heard as there have been John Craddocks, father and son, for ever so long.'

And then they said no more.

Sponsors were a difficulty which bid fair to be almost insuperable, as the girls did not like the idea of a man with a wooden leg who lived near the church, and who was generally had recourse to in such emergencies, being ready to undertake the office for half a pint of beer. But ultimately Mrs Tripp turned up a brother who was a coastguard, and he brought one of his mates to oblige the ladies, so the next Sunday they took the baby to the little church at Beston. Much attention had been given to his toilette;

Alice and Lucy between them had ironed his white robe, though a laundress would have done it much better, and they took ever so long to tie up his sleeves with white ribbon to their entire satisfaction.

They had finally decided on Frederick Reginald Arthur as the names he should bear; but just as they passed into the little white-washed porch of the church, Lucy pulled Alice's shawl.

'I've a mind after all,' she said, 'to alter the name.'

There was such sympathy between the girls, that Alice understood directly what was in Lucy's mind.

'Doe now,' she whispered back. 'I'll be bound he'd be pleased.'

And Lucy answered, 'There! I'll leave it to you. Please yourself.'

'Name this child,' said the clergyman presently, and Alice, with a quick look at Lucy's face, named him 'John,' and Lucy gave a little nod, as if she were not displeased.

'And the very best name he could have!' she declared that evening repeatedly, ignoring all her former opinions. 'And whatever do folks want with more than one name, I'd like to know? And now I come to think of it, my father's name was John; and I'd an uncle too, mother's brother, as was the same, and I'd like to call my boy after one of them.'

SOME DUTCH CHARACTERISTICS.

BY CHARLES EDWARDS.

To my mind, the most remarkable features of Holland at present are the multitude of the advertising placards of the Sunlight Soap and the shape of the Dutchmen's noses. The latter is probably an hereditary and in all likelihood an enduring characteristic. But it does not for that reason impress one the less.

A study of Jan Steen's pictures of Dutch home-life some two hundred years ago proves to conviction that in his day the noses of his country-folk were quite as fantastic as they are now. Without their pendulous, heavy, mirth-inspiring organs of smell, the artist's tipsy fiddlers and peasants, quack doctors and housewives, would not make one smile half as much as they do. It is well that the average Dutchman is a good-natured fellow. No matter whether his amiability be due to his phlegmatic temperament or to the reasoned discipline in his soul: the result is the same to the outer world. If he were naturally disposed to be a prey to his passions, there would be something horribly discordant in the broad comedy of his face.

As for the soap, no doubt Holland ought to be as good a market for the stuff as may be found anywhere on the earth's surface. Many of the country dames and damsels look as if they had been brought up on soap and water. Their faces glisten so preternaturally; their pots and pans, the red tiles of their floors, their tables and benches, all bear witness so unmistakably to their cleansing ardour. I suppose a fly in the butter they were churning, or a mired foot on the boards they have but just scrubbed, would be as nearly likely to give them a fit as anything could be. Winter is a terrible time of trial to them. The

snow, at least in the country, is so nice and spotless that it puts them quite out of humour with the results of their own domestic washings.

Of course different standards of cleanliness prevail throughout the different provinces of Holland. It is one thing to be in the home province, of which Amsterdam is the capital; quite another to be in Drenthe, where the peasants are very poor, and have to wrest a livelihood from peat morasses which we in Scotland or Ireland should regard as irreclaimable. In Drenthe I have entered a house the floor of which was grimed with mud and snow clots that would have made an English peasant woman ill at ease. Here, too, the labourer, his wife, daughter, and two boys were drinking coffee out of cups that were not clean; and the lace headgear which the women-folk wore over the silver plates with which custom bids them cover their foreheads would have been improved by a hearty introduction to the wash-tub. As a rule, however, it may be said that soap is in much more demand in the land of dikes than with us.

A certain inscription in the little house at Zaandam in which Peter the Great lived for a time while he was apprentice to the shipbuilding trade, will, I think, bear excellent adaptation to suit the Dutch character. The inscription says: 'Niets is den grooten man te klein'—'Nothing is too small (or trivial) to the great man.' I propose, therefore, to compliment the Dutch people by changing the words to, 'Nothing is too great for these small men;' and by applying them to the inhabitants of the Netherlands.

At first sight it may appear that the mind of the Dutchman is more apt to be engrossed by the care of little things than great. The Dutch domestic artist with an immense appreciation for details is better known to us than the Dutch artist with conceptions like Raphael's or Michelangelo's. But it ought to be enough merely to hint at the history of Holland to prove the contrary. Where else in the world, too, can we find such gigantic works of their kind as the dikes with which the Dutchmen from year to year keep the sea off their land! Where, too, is there such industrious reclamation of square miles of country, which in other lands would have been regarded as hopelessly good for nothing to the end of time! The 'polders,' or cultivated beds of drained marshes or lakes, are now among the best lands in Holland. And nothing more astounds a visitor to the wilds of such provinces as Drenthe than to discover in the midst of vast expanses of flat heath that seems useless except for the stacks of peat which here and there stand upon it, settlements of hundreds and even thousands of men who have fought with the barren heath and conquered it, even as their more inventive brethren have been able to compel the sea to do their bidding.

I refer more particularly to the Dutch penal institutions between Meppel and Heerenveen. It seems genuine wisdom in the authorities to make the State prisoners do for the worst parts of Holland what nature has neglected to do. Little by little the country will all be cultivated; and at no distant date one will be able to traverse it from end to end and find no purposeless spot upon it. Doubtless the æsthete will ask where lies the merit of turning a land into one great

kitchen garden. But I do not care to concern myself with answering a supposititious question of this kind.

In calling the Dutch 'small men' I would limit the application of the words to the men of Holland proper. The Frieslanders and the people of the neighbouring provinces are almost as different from the dwellers between the mouth of the Maas and the Helder as we ourselves are. They are much taller and more stalwart, and their faces have hardly anything of that farcical cast which sets one laughing at a plebeian Dutchman of Rotterdam or Amsterdam. It is an awful charge to make against the thoroughbred Dutchman, but truth prompts me to declare he has no legs to speak of, even as his wife has no waist, and his daughter no ankles. Seated, the average Dutchman is not conspicuously lilliputian; but when he stands, you discover that Nature has played him a wicked trick in abbreviating his thighs. Of course, however, she compensates him in other directions. She has made him nearly as broad as he is long, and given him such a faculty of patience and long-drawn industry as ensures him as much chance of happiness as the most energetic of tall men has at his disposal. To the accomplished Dutchman it is simply delightful to sit in a 'trekschuit,' or passenger canal boat, and travel twenty or thirty miles in this way at two and a half miles an hour, with a landscape before his eyes that differs not in the least at the end of the five-and-twenty miles from what it was when he began the journey. So he may be allowed a box of tobacco to masticate on the way, or half-a-dozen bad cigars to smoke; so he may have a penny glass of gin now and then when the craving assails him, and be freed from all obligation to be polite—he is what the greatest of men have not succeeded in becoming, to wit, a contented man.

The Frieslander is not such a comatose individual. I speak of him especially when he wears his winter humour. In summer he is no doubt enthusiastic enough; but his enthusiasm is of an agricultural order, pivoting about such things as the butter and cheese he makes and sends to us in England, and the beasts he fattens on the nice broad meadows with which nature has so liberally endowed his dear native land. There is a picture in the Museum of Leeuwarden, the capital of Friesland, which shows that in 1430 A.D. there was a measure of refinement in this remote corner of Europe. It shows us a Friesland family eating their dinner—is it not a subject after the very heart of a Dutchman?—and we mark that the women of the house are allowed to take their place at the table, as if they had as much right to a meal as their lords and masters. The costumes and even the details of the ménage are very much less coarse than one would have expected them to be. And there is a fine fat capon upon the table, which somehow makes one think of the great roofed farmhouses about the province, in one of the barnyards of which it was probably fed through a luxurious summer in the first and only year of its lifetime.

I fancy it is in winter, however, that the Frieslander is most apt to stand his full height, and breathe with the fullest contentment. Certainly, it is more than likely to be rare lusty weather. Gone then for a while are all the green

meadows whence the honours of his butters and cheeses—which have taken so many creditable prices in different market-towns—have proceeded. Bound rudder and sail are then the pleasant chocolate and black boats in which the Frieslander passes so many agreeable summer hours, whether in helping to convey his farm-produce to the markets or the seaport of Harlingen, or in disporting himself on the broad meres which dot his province in the south-west, and which provide him with such toothsome eels for his table. The cows are stalled, and the canals are frozen a foot thick. It is time to put on skates and live the merry winter-life.

Now the average Dutchman of the south, though he can skate very well, looks rather foolish on the ice. His short legs and wide breeches are admirable adjuncts to his nose, his thin cocked beard, and the lumpishness of his expression. To be sure, this breadth makes him look important; but if he were less muscular it would be a sad hindrance to him in battling with the wind, which in winter is apt to make skating in one direction something of a trial.

The Frieslander, however, is taller, better proportioned, and in all respects a handsome fellow. The yellow beard he sometimes wears seems to put him at once on a footing of affinity with the other members of that respectable Anglo-Saxon family to which we ourselves belong; quite as much his provincial speech and his blue eyes. He is a most masterful creature when once he has put on those quaint old-fashioned skates of his, and thinks nothing of making a score of miles from one village to another before you and I are out of bed. As for the cold, what cares he for it? He knows he must rely on that lusty circulation of his to keep him from being benumbed, though he clothe ever so lightly, and seems more regardless of his head—which a sealskin cap takes care of—than of his well-shaped body.

A Friesland canal in winter is as lively as anything can be. The ice may not be very good or of unquestionable strength; but no sooner are the boats penned in and the broken pieces of ice sufficiently welded to allow him to skate between them, than his sport begins. It is a feat of honour to be the first in the district to cross the canal when the wintry season is in its youth. The name of the bold lad is remembered for a week or two; and I have no doubt his pluck stands him in good stead in the esteem of the cherry-cheeked damsels of his province, whose eyes dance past one so brightly when the ice festival is in full swing, and journeying is all done upon skates.

But to recur to some more general features of life in this flat little corner territory of Europe. I was amazed to be told by an intelligent Dutchman of a large market-town that there is a vast amount of religious infidelity among his countrymen. At the first thought I should as soon have expected to hear the like charge brought against Scotland. Afterwards, however, when I had gone elsewhere in the land and looked in the churches, and watched the worthy Dutchman at his devotions, it seemed less surprising.

Upon one of these occasions a small incident happened which has driven one particular church—the large one of Groningen—very firmly into my memory. I was smoking a cigar when I

approached it, and naturally I had either to throw the cigar away or put it into my pocket. So I fancied, at least. Having, as I thought, extinguished it, I pocketed it, and followed certain large-bodied ladies who went in procession to their ugly pews in the noble old building, with their maids behind them carrying footstools, in which pans of peat-embers were to contribute to the comfort of their toes. A horrid smell of burning soon made me wonder how the congregation could endure so defective a heating apparatus. It went with me wherever I strolled in the broad aisles and abandoned choir of the church, and latterly became so insufferable that I went outside to breathe more freely. The next thing that happened was an outcry from a working man who pointed at me—and then I discovered that I was very thoroughly on fire. The thick wool of my coat was smouldering right and left, with a lurid line of fire on both sides. The odd thing was that my friend was a fireman, and that the fire station was close at hand. Thither, therefore, we went and the destruction was arrested; and while I sat among the fire-engines and was told their history and their abilities by one fireman, another brought forth needle and thread and gave me a patching I had no cause to be ashamed of.

From this church I wandered to another almost as large and of the same period. Service was going on; the drowsy voice of the pastor could be heard even in the beautiful forlorn choir which had been boarded away from the rest of the church. Once upon a time it had been a magnificent building. Now it was whitewashed, its chiselled work had been beaten to pieces with hammers, the brasses from the ornate gravestones which paved it had long been torn away, and the very excrescences of the scrolls, floriations, and flourishings which adorned the epitaphs had been scratched at and levelled by iconoclastic imbeciles. Texts from the Bible, the Commandments, the Creed, and the Lord's Prayer, were painted in dark colours upon the glowing white columns of the choir. Where the high altar had been, there was a common table piled with boards and a ladder or two set crosswise. The windows were of common glass, and through a broken pane the chill winter's wind blew upon this cold unedifying scene. And all the while, on the other side of the screen, in the cosy body of the church, there were three or four hundred respectable burghers and their wives in decent Sunday clothes, worshipping in sober brown pews, and keeping themselves comfortable with cushions and stoves. And the men kept their hats on. It is a mournful picture, this succession of wrecked churches wherever one goes in Holland.

For my part, however, I was struck rather by the simplicity of the people than by anything in them which was likely to make them aggressively irreligious. They have an intense love for their unlovely little land. That may be taken for granted. And they have small desire to see the rest of the world, to compare it with the homeland; which alone seems to mark them as a good deal divergent in nature from the main stock whence we also have come. When they are rich, they build themselves pretty little villas, to which they give names much like a child with its dolls. Sometimes the name is a whole text, which must be tiresome for the correspondents of the people

who live in it. Further, they deck the small gardens of their little villas with tiny lakes and fountains, summer-houses in which one person may enter, or two only at a pinch, and bridges not warranted to bear a Dutchman of low degree. These features of Dutch villa-life look strange enough when winter has stripped the surrounding trim-cut little trees of all their leaves, frozen the lakelets, turned the fountains into preposterous images of ice, and covered the baby summer-houses with snow. But in summer they look stranger still. Then the Dutchman and his wife and family may be seen moving about among them, happy as if they were so many children at play. They take tea between the lakelet and the summer-house, and look inexpressible words of felicity at each other. The summer-house itself is of course at the disposal in chief of the elder daughter of the house, and the excellent young man who seems inclined to ask her to marry him. But they cannot always squeeze into it at the same time, which is very tragic.

EXPIATION.

A STORY OF THE CHILIAN REVOLT.

By F. W. EVANS.

IN TWO CHAPTERS.—CHAP. I.

IT was the month of January, the year 1891. Summer in Chili. The Republic was in a state of uneasiness and ferment. The Parliament and the President were embarking on a struggle for the supremacy, a contest which, from the determination expressed on both sides, promised to be bitterly fought out and exhaustive. Partisanship ran high. A wholesome dread of Balmaceda and his merciless method of dealing with his enemies caused many people to conceal their true sympathies; yet there was little doubt but that the adherents of the Congressional party were the strongest in number. The majority of the upper class, with true conservatism, supported the President in his endeavour to attain something like autocratic powers. Among his adherents was Colonel Enrique de Nardez, descendant of an old and ennobled Spanish family. In the war of '64, Nardez did yeoman service; and in all her troubles, Chili had no braver, better defender than he. Enjoying the respect and admiration of all classes, Nardez did not gain, and indeed did not seek, the affection of any. A character stern and unbending, carrying into all the relations of life the strictness of the military martinet, had yet in its innermost recess one spark of truer humanity in a deep-seated and lasting love for George, his motherless son.

Lieutenant George de Nardez held a commission in the navy. Neither expense nor trouble had been spared in his training. A liberal education, concluding at a German university, and embracing a lengthy visit to the United States, had given George broader views and less introspective egotism than the average Chilean. In person he was of average height and average good looks, the latter enhanced by a frank and charming smile. He was as much attached to his father as the latter to him. Their only disagreements were political. George was suspected, and not without reason, of

being more inclined to favour the Parliament than the President. Many sharp words and a few heated arguments had passed between father and son on the subject, without, however, disturbing their mutual affection. Within the last few days, however, a subject of dispute had arisen which threatened graver consequences.

There was at the time residing in the same town a widow lady named Gorman, relict of a prosperous corn-merchant of Santiago, an Irishman, who came to Chili forty years previously to seek his fortune, found it, and, indifferent to the flashing beauty of the Chilean damsels, journeyed home to the Green Island, and brought back as his wife a Scottish girl, whom he found there visiting. The only child of the marriage was a daughter, Ada, who was born in 1871. The mixture of Scottish and Irish blood in her veins had produced a beautiful woman. The best qualities of both nations met in her person; the large, dark, speaking eyes—inherited from her mother—looked out from and lit up a face as clear and delicately complexioned as it is only possible for a healthy happy maiden to possess. Her nose was not of the strictly aquiline type, nor her mouth such an apology for one as we see depicted in fashion plates; but the two soft lips were the most tempting in the world. Without being tall, she had a deliciously shaped figure. Altogether, she was a lovable girl, in manner and character as pleasing as she was physically charming. George de Nardez met her and succumbed. To his intense delight, she proved not indifferent to his society and, after a short courtship, they became engaged, not, however, without the strongest opposition on the part of her mother, who was against the step being taken without the consent or at least knowledge of George's father.

George, however, had pleaded so strongly, urging the unsettled state of the country and his liability to be called away on duty at a moment's notice, that the old lady reluctantly assented to an immediate engagement. It was more difficult to reconcile her to the concealment of the fact from the old Colonel. George was not at fault in thinking his father would be opposed to the match. Truth to tell, the Colonel had other and more ambitious matrimonial views for his son. His heart had long been set on uniting his son to one who could bring not only wealth, but that rank and position which the old aristocrat worshipped. Such a one he had in view for some time, but had not divulged his views until assured of the willingness of the lady's relatives. Learning at last that this assent would not be wanting, he at the next opportunity broached the subject to his son, only to be startled and shocked to find an obstacle in his path of so formidable a nature as George's love for and engagement to another woman.

The two men were sitting in the veranda room of their house in the suburbs of Santiago, when the elder sprang his mine, and the younger the countermine. The Colonel rose to his feet and paced the room with long deliberate strides. He was palpably greatly disturbed and surprised; but in the straight stern lines of his shaven, furrowed face there was no sign of bending from his path. George sat on a chair listening attentively and answering his father respectfully. 'I

cannot, father,' he was saying. 'Even if I was not in love with Ada, I could not now draw back; I have passed my word.'

'That can easily be arranged,' said the old man quickly, pausing in his walk; 'those people will listen to reason.'

'I hope not!'

'You fool—ungrateful fool! is this the reward of all my care and affection?'

'I am very sorry indeed, father, more so than you can'—

'Oh George,' interrupted the Colonel, 'I implore you give up—give up, for my sake, all idea of this—this connection, and take the wife I offer you—handsome, educated, rich, and refined. That is the wife for you, my son, a daughter of our best blood. How can you refuse such an offer, and prefer a'—

'Stop!' thundered George, starting up with an angry gesture. Then, quietly but determinedly: 'Father, I cannot do as you wish.'

'You mean you *will* not.'

'I cannot, and will not. I love Ada with my whole heart and soul. We are betrothed, and, God sparing us, I will marry her.'

'But you shall not!'

'Who—what will prevent me? I am of age.—Oh father! if you ever cared for me, be good to me now. Would you have me take a step which would not only shut out every hope of happiness for me in this world, but would cause me to despise myself for the rest of my days?'

'You talk like a boy. You would forget in twelve months. She, in less.'

George's face lit up with a lover's faith. 'Never, never!' he replied; 'and I will marry her—yes, to-morrow.' This last with sudden impulsiveness.

'You are determined?'

'Yes.'

'Very well, we shall see. Now go!'

When the Colonel spoke in this manner, there was nothing to be done but to obey. After the young man retired, the elder continued pacing up and down the room, displaying, however, more agitation than he had allowed himself to show in his son's presence. He was enduring a great inward struggle. He stopped in his walk every now and then, as though struck by some fresh idea, and then, with an eloquent despairing gesture, resumed his promenade. At length he sat down at a desk and hurriedly wrote a letter. Having folded and directed it, he placed it in his pocket and left the house.

Meanwhile, George, on leaving his father, had walked quickly into the city and wended his way to the house of his betrothed's mother. The ladies were not at home when he arrived; but he elected to wait, and thus gained time to subdue his agitation and attain at least outward calmness before they came in. Control as he might, however, he could not entirely conceal his excitement. Ada was quick to see something untoward had occurred, and it was not long before George had informed them of all that had passed between his father and himself.

The elder lady was, of course, inclined to temporise; and, regarding the Colonel's consent as an almost indispensable condition, would not at first hear of anything but submission and patience.

'I would be patient to wait,' said George—'wait for years, but I know it would be in vain.

Nothing will influence my father. I know him. If I don't marry Ada now, at once, I shall not have another opportunity.'

'I don't understand that,' said the widow.

'My father has enormous influence. He has the ear of the President,' explained George; 'and he will stop at nothing, hesitate at no measure to prevent our marriage. He could have me sent away—practically banished.'

'What do you propose?' said Mrs Gorman, hesitatingly.

'I told my father we would be married to-morrow. Whatever steps he takes, will be in view of that. I must anticipate him. It must be done at once, before he moves.'

'What! to-day? You think to be married to-day?'

'Yes, with Ada's consent.' He turned to his sweetheart and took her hand. 'Will you, Ada,' he asked pleadingly—'will you marry me to-day?'

The girl's eyes filled with tears, and saying 'Yes,' she burst out crying. 'He will take you from me, George, even after we are married.'

'No, not that. When he knows we have taken the irrevocable step, his opposition will cease. He won't fight mountains, and would not stoop to revenge.'

Ada turned an imploring look towards her mother, and that mute appeal moved her more than the man's arguments.

'Well,' she said at length, 'if it can be managed, I consent.—When, where, and how do you suggest?' she continued, addressing George.

'This evening, at San Jose de Ferrara. I will go at once and make all arrangements.'

Ada went up to her lover, and putting one hand on his shoulder, looked straight into his eyes. 'To-morrow, George?' she said; 'let me be my mother's till to-morrow.'

'It cannot be, Ada. To-morrow—to-night may be too late,' replied George.

One moment's hesitation, then Ada yielded; and the widow held out her hand to George, saying, 'As you will.'

The young man kissed them both affectionately, and, promising to be back in an hour, hurried away.

The ladies set about making such preparations as the short time allowed would permit; but even this was curtailed, the sound of great excitement in the streets attracting them to the windows. Crowds of people were out, and speedily the news spread: 'Civil war had broken out!' The Congress troops had taken the field.

Before the hour expired, George returned. He also had heard the news, and hastened to reassure the ladies by his presence. 'This is an additional reason for hurrying the marriage,' he said; 'I have arranged everything.'

A few hours subsequently, a small party of six persons, consisting of George Nardex and his bride, the latter's mother with a lady friend, and two officers in civilian dress—friends of the bridegroom—emerged from the little chapel of San Jose de Ferrara, and entering a couple of hired carriages, drove away.

By this time the streets were in an uproar. The greatest excitement was visible everywhere and in everybody. Shouting and singing, laugh-

ing and drinking; troops marching, bands playing. Strange that nothing but war, cruel war, could cause so much of what looked like joy.

As the bridal party entered the street in which the Gormans resided, usually a very quiet place, they saw that the excitement seemed to be concentrated, centred on one spot, and that the door of Mrs Gorman's house. A small crowd of loungers, strollers, and neighbours had gathered, in the midst of which a number of uniforms were discernible. As the carriages drove up, the crowd parted and became silent. The widow's face assumed an expression of puzzled anger, and she instinctively turned an interrogative look on her son-in-law. The latter's face was as white as death; but curbing his emotion as well as he could, he descended, handed out the two elder ladies, and then turned to assist his bride.

As she came down in his arms, she whispered: 'What is it, George?'

Before he could answer, the officer in charge of the soldiers stepped forward, touched him on the arm and said: 'Lieutenant George de Nardez! I think?'

'The same, sir. What is it?'

'You must come with me. You are arrested.'

'Arrested! On what charge?' The words were words of surprise, but there was no astonishment visible in George's face.

Ada, who had watched his face intently with her arm within his, now withdrew it, and stole it protectingly round his shoulder.

'I arrest you on a charge of being inimical to the Government,' said the officer formally.

'I have just been married,' faltered George, unconscious in his agitation of the irrelevancy of his reply.

'I am deeply, truly sorry to have such a duty to perform and at such an hour,' said the officer; 'but I must carry out my orders. I can only grant you five minutes' grace, and in doing that shall be straining my discretion.'

'May I enter the house and bid my wife farewell?'

'Certainly. I have your parole?'

'Yes. I thank you.'

At the expiration of five minutes, George reappeared and surrendered. One of the bridal carriages was chartered. George took his seat; and then, with his captor by his side instead of his bride, and two armed soldiers for bridesmaids, he was driven away to spend his wedding night in prison.

The military prison to which George was conveyed was but partly filled on his arrival; but within a few hours prisoners began to file in rapidly. The emissaries of the President had, on the first sign of active rebellion, laid their hands on all known or suspected opponents within reach: The young lieutenant passed a very bitter night. In addition to the agony of such a parting and a great anxiety as to his wife's bearing under the shock, he was tormented by the uncertainty connected with his arrest. Was it due to his father's action, or solely to his own political opinions? In the former case, he might hope for a speedy release when the futility of the step became manifest. The morning dragged slowly on without anything arising to resolve this doubt. About noon, however, and before the meal hour, footsteps approached his cell.

The door was opened, and Ada and her mother entered, accompanied by Don Manuel Pulido, a lawyer and friend of the family. George sprang to his feet, and without a word the lovers were in each other's arms. The other two turned away for a moment, respecting alike the bitterness and the bliss of the meeting. Time, however, is precious at a prison interview.

Don Pulido spoke, and addressing George, said: 'I have obtained permission for this meeting with great trouble and some risk. It must only last a quarter of an hour. Make the most of it. Why are you here? Have you been formally charged?'

'No. I know nothing beyond what the officer said when arresting me,' replied George.

'And that was?'

'That I was arrested as inimical to the Government—meaning, I presume, the President.'

'Do you know the Congress party is in open rebellion?'

'I learned it yesterday.'

'That lends seriousness to your arrest.'

'I have reason for thinking my apprehension on that charge was a mere ruse.'

'How? You must be candid.'

George looked at Ada, as though he would spare her. She saw and rightly interpreted the glance, and taking his hand in hers, said: 'Go on, George. I have a right to know everything now, and strength to hear anything.'

'Well, you must know,' said George, addressing Pulido, 'my father was opposed to our marriage. At our last meeting yesterday we had high words on the subject. When he saw I would not yield to persuasion, he threatened to prevent our union at any cost and—I fancy he may have used his influence and caused my arrest in order to attain this object.'

'Is that possible?' said the lawyer.

'Thinking, no doubt,' continued George, 'to frighten me into submission, and relying on his position and influence to prevent any—'

At this moment the cell door was again opened and Colonel Nardez entered. He was evidently prepared to find others there, and bowed courteously to the ladies, while greeting the lawyer by name. He then turned to his son; but the old fearless look was gone from his eyes, and his glance was hesitating and shifty. The old soldier was ashamed, and to cover his embarrassment assumed an overbearing manner. 'Well,' said he, 'I hope you have come to your senses?'

'Have I been without them?' queried George.

'You have been mad!'

'This isn't exactly the place to cure madness.'

'No, but folly—yes!'

'Let me assure you, father, that mine is a folly, if you choose to call it so, that no time will cure or any coercion diminish.'

'Are you aware of the terrible position in which you stand?' queried the elder man.

'I am, and also to whose unnatural action I owe it.'

The random shot hit the mark, and George's spirits rose. He was much the calmer and more collected of the two.

'Why did you defy me?' The Colonel's voice faltered. He began to display great agitation.

'I could not do otherwise, father—could not. Forgive me now for not obeying you in this.'

Take me out of this. I presume that as you had me confined, you can also have me released?' 'God knows,' muttered the father, 'I am myself unaccountably under suspicion now. Oh, why did you defy me?' he reiterated, and there was something in his tone as well as in the words that roused apprehension.

George waited anxiously. In the elder man's mind a struggle was going on. 'Will you give this—this idea—this marriage up?' dropped slowly from his lips, and he looked eagerly into his son's face.

'I cannot—on my honour, I cannot. It is much too late,' replied George firmly.

'Would you rather—remain a prisoner?'

'If that is the alternative—Yes!'

'Will you remain a prisoner until—until some morning you are taken out and shot?' demanded the Colonel in a low voice of suppressed anxiety. 'What will that profit you? You could not marry then.'

'I am not going to marry again,' said George with a ghost of a smile.

'Again! Why, what do you mean?'

George took Ada by the hand, and advancing a step, presented her formally to the Colonel. 'My wife,' said he. 'We were married yesterday.'

The old man started as though he had been struck; then he bowed low. When he stood again upright, all the assumed sternness had passed out of his face, and an ill-concealed anxiety and remorse taken its place. He did not, could not speak. His better nature, his strong natural affection for his son, was conquering the pride and obstinacy of his character. At the moment when the struggle was at its fiercest, Ada threw herself on her knees at his feet, sobbing. The scale was turned. The old soldier lifted the girl gently, looked at her a moment critically, and kissed her. Then turning to his son, he extended his hand with a gesture of reconciliation. For a moment the three were locked together in an embrace. Then the elder loosened himself and spoke. 'I should be on my knees now, praying and begging for pardon,' he said fiercely.

Mrs Gorman and Don Pulido had been silent but interested spectators of the moving scene, but at this juncture the lawyer interposed. 'Permit me,' he said, 'to congratulate you all round on the understanding arrived at. Now, I advise strongly that no time be lost in effecting your son's release. In the present state of affairs, he is in a critical position.'

'You are right,' said the Colonel: 'it must be done at once.'

'May I ask, Colonel,' continued the lawyer, 'if you were instrumental in causing his arrest?'

'Yes,' was the low reply. 'It was only to be a temporary measure.'

'Then you can manage his release speedily?'

The Colonel was silent; a terrible anxiety fastened on the others. 'Yes, I suppose so. I don't know! Oh miserable father that I am! I will go at once; but I fear the shadow of suspicion has fallen on me. God grant I may be mistaken!'

'What steps do you propose to take?' asked the lawyer. 'Can I be of any assistance?'

'I will see Balmaceda at once, and state the entire facts. He can scarcely refuse me a favour.'

'But where is he? He left the capital last night.'

The Colonel bit his lip with vexation. 'I will follow him,' he said. 'I can surely find out his whereabouts. I must see him personally. I could do nothing with any of the others.'

'Then come at once. I must escort the ladies home, and then am at your disposal, if I can be of any use whatever.'

Colonel Nardez turned to his son, and clasping his hand, said: 'Cheer up, George; I have every hope of success. He cannot turn against me or refuse any reasonable request of mine. Be of good heart, my son. Forgive me, if you can now; but I must wait until you are free before I can ask your pardon.'

'You have it freely now, father. Whatever happens, I know you have done nothing but in care of me.'

Steps were heard in the corridor.

'Time is up,' said Don Pulido; 'we have trespassed already.'

Before George could kiss his bride good-bye, the chief of the prison entered accompanied by another official and a warder. 'Colonel de Nardez,' said the first-named, 'you had permission to visit the prison and have an interview with your son. I regret to inform you that your visit must be prolonged.'

'What do you mean?' demanded the Colonel sternly.

'This gentleman will explain,' said the chief, indicating his companion.

'I am the bearer of orders from the President,' said the official, 'ordering the arrest and detention of Colonel de Nardez, who has become suspected of intriguing against the Government.'

'There must be some mistake,' said the Colonel in desperation. 'I am one of his Excellency's friends.'

'His Excellency is become mistrustful of his friends,' remarked the official dryly. 'However, my task is ended.—I leave Colonel de Nardez in your custody,' he concluded, addressing the jailer.

'Permit me,' said the latter, indicating the door.

The old Colonel turned on his son a look of the keenest remorse and appeal, and then followed his custodian from the cell.

No further time was granted to the others, and they were compelled to take a hasty farewell, crushed and desperate at the turn affairs had taken. George still had spirit to whisper: 'Courage, my darling; it will not be for long. Balmaceda will be surely beaten, and then'—A fervent kiss concluded the sentence, and a minute afterwards George was alone.

REFUSE DISPOSAL.

THE rapid accumulation of rubbish is unhappily too well known to need special comment. Every one of our readers is familiar with the constant warfare with refuse in every shape and kind, necessary to maintain our houses and streets in a healthy and sanitary condition. The problem in large cities is a serious one, and the cleansing and scavenging duties of the local authorities, whether viewed in the light of their unintermittent nature, or the serious danger to the public entailed by neglect or failure, are of far greater importance to society than many topics which more readily command attention.

As our readers are doubtless aware, the Public Health Acts impose on every Local Authority the duty of the removal of ashes, dust, and rubbish generally from every house. Into the vexed questions of the best methods of storing that rubbish and removing it, we do not propose to enter; various modes are in vogue, each possessing distinct advantages, and each requiring to be considered in relation to the particular needs and characteristics of any city or locality under consideration. Our present concern is rather the ultimate disposal of the collected rubbish, a problem, we may add, which is occupying the serious attention of sanitary engineers and municipal authorities. As is well known, 'town refuse' is largely used for manurial purposes in agriculture; but not only is this mode of disposal liable to objection on the ground of the unpleasant odour caused, but it is understood that in many cases the value of such refuse for spreading on the land has declined, owing to various causes, such as the improved methods of combustion now in vogue, with corresponding diminution in the quantity of ashes thrown away; whilst the extended use of tinned goods has not merely lessened the amount of organic refuse, but has introduced into house refuse a large body of rubbish whose profitable utilisation has hitherto baffled the efforts of the economist.

No one who has noticed, we may remark in passing, the enormous quantities of empty tins bestrewing the country, will fail to admit the desirability of, and the enormous profit attending, a successful method of turning such to useful account. We believe tin toys have been profitably manufactured from empty sardine boxes; but the supply of raw material is far in excess of the demand for the finished product.

Turning to other methods of disposing of town refuse, that of tipping to form 'made-ground' for building purposes is highly objectionable on sanitary grounds, and even in the case of land at all likely to be used for residential purposes is to be strongly deprecated.

A third method—namely, deposit at sea, as practised in New York and Liverpool—is fully described by Mr Percy Boulnois, M.Inst.C.E., in an able paper recently read in Liverpool. In the case of Liverpool, two special steamers, carrying respectively three hundred and thirty and four hundred tons of refuse, are constantly employed in taking the material twenty-four miles out to sea and there depositing it. Mr Boulnois states that during 1891 no fewer than 145,032 tons of refuse were thus disposed of, at a cost of approximately 1s. 6½d. per ton. As pointed out in the paper above mentioned, this system is applicable only for cities near the coast; and the liability of the lighter refuse to float and be washed again on shore, forms a serious drawback. Moreover, trawling-nets are liable to injury from tinned-meat cases, &c.

The difficulties of other large cities in connection with the disposal of their refuse, and the constant questions arising in reference to the nuisance and undesirability of the material in question, are well known of late years. Recently, the material has been disposed of by burning, and the name of 'Refuse Destructors' has been given to the furnaces in which the operation has been performed. This system is growing in

favour, and the problem seems only what is the least cost at which it can be performed. Various types of Destructor are now in operation; and though it scarcely falls within the scope of this article to detail the different designs in use, we may point out that the principal points aimed at in each, as enumerated by Mr Boulnois, are: (1) Ease of access by carts; (2) Ease of charging furnaces; (3) Perfect combustion without nuisance; (4) Easy withdrawal of 'clinker'; (5) Reduction of the refuse to as small an amount of clinker and ash as possible; and (6) Expeditious combustion.

The cost of destruction of refuse by burning necessarily varies much in different districts, as quality of refuse, rate of wages, &c., fluctuate; but in the paper already quoted the rate per ton is given as ranging between sixpence and two shillings and threepence.

The site of a Refuse Destructor is necessarily a question involving much anxiety; for even with total cremation of all fumes in the Destructor, the refuse has still to be conveyed to it, and care has to be taken to cause as little nuisance as possible in conveying the material to the flames. The heat generated in a Destructor can be utilised for a variety of purposes, such as raising steam for electric light, pumping, &c.

In conclusion, the cremation of refuse is rapidly establishing itself, and bids fair to extend considerably. The problem is largely one of cost, as the system complies in all respects with sanitary science, and cannot fail to commend itself to every person interested in a question which, both directly and materially, concerns the whole community.

WESTWARD.

Westward the sunset is dying,
For twilight has gathered and grown;
Westward the swallow is flying,
The way that the Summer has flown—
Flying, flame-crown'd and crested
With light from the day that is spent,
After the Summer that rested
Awhile in our meadows—and went.

Westward the breezes are blowing
And breathing of nothing but rest;
Westward the river is flowing—
Thy home is there in the west,
And Summer around thee is springing,
But Autumn is lingering with me,
And westward my fancies are winging
Their flight unto thee—unto thee!

Ah, dreary and darkly and slow drifts
The time to the end of the year!
Blow, winds of the Winter, with snow-drifts,
And frost upon moorland and mere,
With the day when at last I shall follow
The flight of my thoughts and have rest,
Shall follow and find, like the swallow,
My Queen of the year in the west.

ON GRIEF.

THERE may be more truth in the Stoic philosophy that denied grief to be grievous or pain an evil, than we moderns, with our army of anodynes, are willing to admit. In a day when morphia and chloroform, poppy and mandragora, and all the drowsy syrups of the East, are constantly being had recourse to for ills our forefathers endured with Indian fortitude, men are becoming nice and delicate, unwilling even to admit the fellowship of Grief. All periods of mourning are shortened: life, we say, is too brief to be passed in vain retrospects; put a gloze on sorrow; assume a cheerfulness if you have it not; do not shut yourself up with your unhappiness; if you have a grief, hide it; mingle with the crowd, and by-and-by you will cease to feel it. This mode of dealing with sorrow at least possesses one undeniable advantage—it exonerates our friends from showing sympathy, real or affected. And the man who can show a front of cheery stoicism under unhappiness, one who does not visit upon another human being the neglect or calumny which the day may have brought him, deserves praise. If, moreover, he is conscious of having acted unwisely, or his spirit is galled and vexed by the importunate remembrance of past follies; if he can still maintain his usual air of calm and good-humour, he is still further to be honoured for his wisdom. And if he be wise, he knows that few things take the flavour out of life more completely than going perpetually over the same ground in one's thoughts, dwelling on the 'devilry of circumstances,' whereby a small inlet of mischance has broadened into a flood of evil. A man who broods thus over a vexation—eating his own heart, as it were—is unaware, it may be, that the scourge under which he winces is wielded by himself—by his own pride. He is resolved at any cost to redeem the past—to cancel by success his first error or folly; and thus he keeps the wound raw, whereas, if he could once for all acknowledge his past want of wisdom, the

strength he has at his command would be his to labour with, unhampered by vain regrets.

But griefs whose dirge it is well to have sung and be done with, are not all of this nature. They are as various as the beings who suffer them; and that which crushes one, drives another to madness or suicide, or both, yet leaves a third stronger and sounder for the ordeal through which he has passed. Through it he attains to a health and vigour of soul which no mere enjoyment, however pure and right in itself, could give him. It has added elasticity as well as strength to his perceptions—like an ash-tree that, grown in the shade, possesses twice the suppleness, as well as double the resisting power, of one that has sprung up in sunshine. We venture to assert that no human being in this world can be all that he was born capable of becoming unless his soul has been purged by intensest sorrow. Our griefs, too, are the pass-keys by means of which we gain admission into the darkened chambers of another's spirit. By them are we made free of the guild; they enable us to minister to the sad and the lonely by virtue of that fellowship and sympathy which is the child of knowledge and experience. This is one of the advantages bestowed by grief—perhaps the greatest that it has to give. Another valuable fruit of sorrow is that it enables us to estimate at their true value a hundred little daily and hourly vexations, which shrink and dwindle in the presence of majestic grief, ashamed of their own pettiness.

Often grief puts a period to anxiety—a sad ending, perhaps, but still an ending. We have watched, it may be for weeks, beside a sick-bed, now hoping, now fearing; the tension grows with every hour's anxiety, until it is almost too great for human endurance, and at last the bolt is shot, and we are left to face life without the one who was the very life of our lives. But—it is all over; and our consolation must be that the anguish and the dull succeeding blank is ours, not theirs. And if we have parted in unabated love, who shall say that the parting

was ill timed? Misunderstandings, alienation, can never come now; the beloved image is ours, clear and bright for ever.

We have said griefs are as various as those who endure them; and we may add, borne in as many various ways as there are individual sufferers. There is the loud, vehement, passionate grief that wears itself out by its own violence; and there is the deep quiet sorrow that wears itself into the character, purifying every emotion, sanctifying every impulse.

Some, sorrow stuns—turning heart and face to stone. After a great grief, these will pass through life afterwards as though incapable of either joy or sorrow more. These are chiefly those—like the king 'who never smiled again'—upon whom sorrow has fallen suddenly and unexpectedly, like a bolt from a clear and apparently propitious sky. Others, again, grief renders bitter; and forthwith they make a mock of all things, including themselves; striving to find in scorn and satire a bitter solace for their disenchantment. Of these are the proud in spirit, who covet respect, and despise sympathy, and fairly hate pity. Others, on the contrary, crave so keenly to be commiserated, that every one about them, yea, even those who only casually look upon their lined and puckered faces as they meet them in the streets, cannot choose but recognise, and in a manner feel for, the piteous griefs that have left such seams and scars behind them.

Again, there are dispositions that grief turns acid and acrid, making their owners worry and fret about every trifle that goes wrong, urging them to anticipate the dark side of every event not yet come to pass, to express but a grudging satisfaction when their prophecies are unfulfilled, and who perfectly revel, when the event justifies their forebodings, in saying triumphantly: 'I told you so.' Some—and these not a few—find relief from grief in anger, in irritability and exactions, who resent other folks' happiness as an insult almost to their gloomy selves. And having indulged a habit of discontent, fostered the growth of persistent disparagement until praise or commendation is with them almost an impossibility, they wake up at last to find themselves isolated, avoided, left solitary, amid the dreary ruins of a life that their own hand has so greatly helped to wreck.

A foolish family pride lies at the root of many a grief. A child has erred perhaps, erred madly, wickedly; we long to forgive—to take back the weak, the unstable, the repentant sinner; we *know* that in such forgiveness lies our own only chance of peace of mind, of happiness, as well as his only, or, at any rate, his best chance of reformation, of rehabilitation. But—'He has disgraced the family;' and our pride and vanity revolt equally with our virtue at the idea of reinstating the erring one. And thus the evil that might have been single and transitory becomes permanent—permanent as our grief—a grief tinged with remorse not undeservedly, in that we have, under whatever name we may disguise it, preferred to pamper our pride—to courageously holding out openly a helping hand to the foolish, dejected, hopeless backslider.

We may reckon on our fingers the friends who would stand by us in grief, in poverty, in sick-

ness; we are fortunate indeed if we can securely reckon on one who will stand by us in the greatest grief of all, in shame, in disgrace. And yet it is all but impossible for us to be acquainted with the causes of the career which have led to the catastrophe on which we so glibly pronounce judgment.

The very possible ill management of parents, the probable temptations, are all, or almost all, hidden from us. Yet we immaculate vases look down from under our glass shades with a scarcely justifiable self-satisfaction on the poor little pitcher that has been carried once too often to the well. Dante puts into the mouth of Francesca the oft-quoted saying that there is no grief so deep as that of remembering happier days in present distress. But that is so only when, as in Francesca's case, it is remorse that is speaking. She sorrowed, and sorrowed justly, for the happy, honourable days before that one on which 'they read no more.' But let the happiness that once was ours be untinged by remorse, by self-reproach, and be our present horizon ever so gloomy, memory will send a twilight glow from the past into our minds; and we say, and say truly, that 'it is better to have loved and lost than never to have loved at all.'

In like manner, those who have lost a fortune may console themselves that at least they have had a fortune to lose. Many there are who have never even seen 'better days.' And supposing what the world calls good fortune to have continued uninterrupted—supposing we have never lapsed from the small circle of self-satisfied prosperity, it is possible that this, too, might constitute a misfortune in itself, by fostering our egotism, dulling our imaginations, narrowing our sympathies.

It is inexperience, or feebleness of insight, that makes us look at life as a child at a statue: so round, so smooth, soft surely, and responsive. But when we touch it, we *feel* how cold and hard and insensate is the marble of which it is composed; yet, having learned certain truths and limitations respecting it, and having got, as it were, to the right stand-point, the marble regains somewhat of the fascination of its old smooth beauty.

We learn to manage our griefs, so to speak; we recall the great and wise sayings uttered of old by the great and wise to comfort and aid their brethren in adversity. If we cannot forget our sorrows, we learn to occupy our minds with other things. True, they are our very own—our dear-bought possession. Any accident may deprive us of our joys, but our sorrows are at least our own. Yet is it not wise to dwell wholly on our grief freehold: we must pass the boundaries, venture upon higher ground, become acquainted with the mode in which our neighbours cultivate their domains, acknowledge them to be perhaps even wider than our own—put to better uses, made more profitable by better husbandry. It is a poor pride that makes us shrink from learning a lesson from others' management of their 'heritage of woe.'

What, beyond sympathy, may we reckon as a fruit of the inheritance in which we all share? For one thing, a knowledge of ourselves. Until the storm came and tested us, we neither knew

how frail nor how strong we were. For another—if it has been allowed its dues, it has begot a fortitude and a preparedness in us; a resolve and a readiness if need be to suffer; and lastly, a great peace, in that we have done with sickly uncertainties, vain hopes, selfish longings; and leaning on the strengthening arm of our grief, we can smile alike at the blandishments or frowns of a blind or fickle Fortune.

BLOOD ROYAL.*

CHAPTER X.—MR PLANTAGENET LIVES AGAIN.

OUTSIDE college that same afternoon, Trevor Gillingham in a loud check suit lounged lazily by the big front gate—on the prowl, as he phrased it himself, for an agreeable companion. For the Born Poet was by nature a gregarious animal, and hated to do anything alone, if a comrade could be found for him. But being a person of expansive mind, ever ready to pick up hints from all and sundry, he preferred to hook himself on by pure chance to the first stray comer, a process which contributed an agreeable dramatic variety to the course of his acquaintanceships. He loved deliberately to survey the kaleidoscope of life and to try it anew in ever-varying combinations.

Now the first man who emerged from the big gate that afternoon happened, as luck would have it, to be Richard Plantagenet in his striped college blazer, on his way to the barges. Gillingham took his arm at once as if they were boon companions. 'Are you engaged this afternoon?' he inquired with quite friendly interest. 'Because, if not, I should so much like the advantage of your advice and assistance. My governor's coming up next week for a few days to Oxford, and he wants some rooms—nice rooms to entertain in. He won't go to the *Randolph*—*banal*, very, don't you know—because he'll want to see friends a good deal: he's convivial, the governor; and he'd like a place where they'd be able to cook a decent dinner. Now, Edward Street would do, I should think. First-rate rooms in Edward Street. Can you come round and help me?'

He said it with an amount of *empressement* that was really flattering. Now Dick had nothing particular to do that afternoon, though he had been bound for the river: but he always liked a stroll with that brilliant Gillingham, whom he had never ceased to admire as a creature from another social sphere, a cross between Lord Byron and the Admirable Crichton. So he put off his row, and walked round to Edward Street, the most fashionable quarter for high-class lodgings to be found in Oxford. Sir Bernard, it seemed, had just returned to England for a few short weeks from his Roumanian mission, and was anxious to get decent rooms, his son said, 'the sort of rooms, don't you know, where one can dine one's women folk, for he knows all the dons' families.' They looked at half-a-dozen sets, all in the best houses, and Gillingham finally selected a suite at ten guineas. Dick opened his eyes with astonishment at that lordly figure: he never really knew till

then one could pay so much for lodgings. But he concealed his surprise from the Born Poet, his own pride having early taught him that great lesson in life of *nil admirari*, which is far more necessary to social salvation in snob-ridden England than ever it could have been in the Rome of the Cæsars.

On their way back to college, after a stroll round the meadows, they met a very small telegraph boy at the doors of Durham. 'Message for you, sir,' the porter said, touching his hat to Dick; and in great doubt and trepidation, for to him a telegram was a most rare event, Dick took it and opened it.

His face flushed crimson as he read the contents; but he saw in a second the only way out of it was to put the best face on things. 'Why, my father's coming up too,' he said, turning round to Gillingham. 'He'll arrive to-morrow. I—I must go this moment and hunt up some rooms for him. My sister doesn't say by what train he's coming; but he evidently means to stay, from what she tells me.'

'One good turn deserves another,' Gillingham drawled out carelessly. 'I don't mind going round with you and having another hunt. I should think that second set we saw round the corner would just about suit him.'

The second set had been rated at seven guineas a week. Dick was weak enough to colour again. 'Oh no,' he answered hurriedly. 'I—I'd prefer to go alone. Of course I shall want some much cheaper place than that. I think I can get the kind of thing I require in Grove Street.'

'As you will,' Gillingham answered lightly, nodding a brisk farewell, and turning back into quad. 'Far be it from me to inflict my company unwillingly on any gentleman anywhere. I'm all for Auberon Herbert and pure individualism.—I say, you, Faussett: here's a game;' and he walked mysteriously round the corner by the Warden's Lodgings. He dropped his voice to a whisper: 'The Head of the Plantagenets is coming up to-morrow to visit the Prince of the Blood: fact: I give you my word for it. So we'll have an opportunity at last of finding out who the dickens the fellow is, and where on earth he inherited the proud name of Plantagenet from.'

'There were some Plantagenets at Leeds—no; I think it was Sheffield,' Faussett put in, trying to remember. 'Somebody was saying to me the other day this man might be related to them. The family's extinct, and left a lot of money.'

'Then they can't have anything to do with our Prince of the Blood,' Gillingham answered carelessly; 'for he isn't a bit extinct, but alive and kicking: and he hasn't got a crooked sixpence in the world to bless himself with. He lives on cold tea and Huntley and Palmer's biscuits. But he's not a bad sort, either, when you come to know him; but you've got to know him first, as the poet observes: and he's really a fearful swell at the history of the Plantagenets.'

Dick passed a troubled night. Terrible possibilities loomed vague before him. Next day, he was down at the first two trains by which he thought it at all possible his father might arrive; and his vigilance was rewarded by finding Mr Plantagenet delivered by the second. The Head of the House was considerably surprised and not

* Copyright 1892 in the United States of America by the Cassell Publishing Company.

a little disappointed when he saw his son and heir awaiting him on the platform. 'What, you here, Dick!' he cried. 'Why, I wanted to surprise you. I intended to take my modest room for the night at the same hotel at which you stopped—the *Saracen's Head*, if I recollect the name aright—and then to drop in upon you quite unexpectedly about lunch-time.'

'Maud telegraphed to me that you were coming, father,' Dick answered, taking his hand, it must be acknowledged, a trifle less warmly than filial feeling might have dictated. Then his face grew fiery red. 'But I've engaged rooms for you,' he went on, 'not at an inn, on purpose. I hope, father, for your own sake, as well as for mine, while you're here in Oxford, you won't ever so much as enter one.'

It was a hard thing to have to say; but for very shame's sake, Dick felt he must muster up courage to say it. As for Mr Plantagenet himself, poor old sot that he was, a touch of manly pride brought the colour just for once to his own swollen cheek. 'I hope, Richard,' he said, drawing himself up very erect, for he had a fine carriage still, in spite of all his degradations—'I hope I have sufficient sense of what becomes a gentleman, in a society of gentlemen, to think of doing anything that would disgrace myself, or disgrace my son, or disgrace my name, or my literary reputation—which must be well known to many students of English literature in this university—by any unbecoming act of any description. And I take it hardly, Richard, that my eldest son, for whom I have made such sacrifices'—Mr Plantagenet had used that phrase so often already in the parlour of the *White Horse* that he had almost come by this time to believe himself there was really some truth in it—'should greet me with such marked distrust on the very outset of a visit to which I had looked forward with so much pride and pleasure.'

It was quite a dignified speech, for Mr Plantagenet. Dick's heart was touched by it. 'I beg your pardon, father,' he replied in a very low tone. 'I'm sorry if I've hurt you. But I meant no rudeness. I've engaged pleasant lodgings for you in a very nice street, and I'm sure I'll do everything in my power to make your visit a happy one.' As he spoke, he almost believed his father would rise for once to the height of the circumstances, and behave himself circumspectly with decorum and dignity during his few days at Oxford.

To do Mr Plantagenet justice, indeed, he tried very hard to keep straight for once, and during all his stay, he never even entered the doors of an hotel or public-house. Nay, more; in Dick's own rooms, as Dick noticed with pleasure, he was circumspect in his drinking; it flattered his vanity and his social pretensions to be introduced to his son's friends and to walk at his ease through the grounds of the college. Once more for a day or two Edmund Plantagenet felt himself a gentleman among gentlemen. Dick kept as close to him as possible, except at lecture hours; and then, as far as he could, he handed him over to the friendly care of Gillespie, who mounted guard in turn, and seemed to enter silently into the spirit of the situation. As much as possible, on the other hand, Dick avoided for those days Gillingham and Faussett's set, whose

only one wish, he felt sure, would be to draw his father into wild talk about the Plantagenet pedigree—a subject which Dick himself, in spite of his profound faith, had the good sense to keep always most sedulously in the background.

For the first three days, Dick was enabled to write nightly and report to Maud that so far all went well and there were no signs of a catastrophe. But on the fourth day, as ill-luck would have it, Gillingham came round to Faussett's rooms full of a chance discovery he had that moment lighted upon. 'Why, who'd ever believe it?' he cried, all agog. 'This man Plantagenet, who's come up to see his son, the Prince of the Blood, is a decayed writer, a man of letters of the Alaric Watts and Leigh Hunt period, not unheard of in his day as an inflated essayist. I know a lot of his stuff by heart—Hazlitt-and-water sort of style; De Quincey gone mad, with a touch of Bulwer: learned it when I was a boy, and we lived at Constantinople. He's the man who used to gush under the name of Barry Neville!'

'How did you find it out?' Faussett inquired, all eagerness.

'Why, I happened to turn out a Dictionary of Pseudonyms at the Union just now, in search of somebody else; and there the name Plantagenet caught my eye by chance: so of course I read, and, looking closer, I found this fact about the old man and his origin. It's extremely interesting. So, to make quite sure, I boarded Plantagenet five minutes ago with the point-blank question. "Hullo, Prince," said I, "I see your father's Barry Neville the writer." He coloured up to his eyes, as he does—it's a charming girlish trick of his; but he admitted the impeachment. There: he's crossing the quad now. I wonder what the dickens he's done with his governor!'

'I'll run up to his rooms and see,' Faussett answered, laughing. 'He keeps the old fellow pretty close—in cotton wool, so to speak. Won't trust him out alone, and sets Gillespie to watch him. But an Exeter man tells me he's seen the same figure down at a place called Chiddingwick, where he lives, in Surrey: and according to him, he's a rare old buffer. I'll go and make his acquaintance, now His R'yal Highness has gone off unattended to lecture: we'll have some sport out of him.' And he disappeared, brimming over, up the steps of the New Buildings.

All that afternoon, in fact, Richard noticed for himself that some change had come over his father's spirit. Mr Plantagenet was more silent, and yet even more grandiose and regal than ever. He hadn't been drinking, thank Heaven; not quite so bad as that, for Dick knew only too well the signs of drink in his father's face and his father's actions; but he had altered in demeanour, somehow, and was puffed up with personal dignity even more markedly than usual. He sat in and talked a great deal about the grand days of his youth; and he dwelt so much upon the past glories of Lady Postlethwaite's *salon* and the people he used to meet there that Dick began to wonder what on earth it portended.

'You'll come round to my rooms, father, after Hall?' he asked at last, as Mr Plantagenet rose

to leave just before evening chapel. 'Gillespie'll be here, and one or two other fellows.'

Mr Plantagenet smiled dubiously. 'No, no, my boy,' he answered, in his lightest and airiest manner. 'You must excuse me. This evening, you must really excuse me. To tell you the truth, Richard—with profound importance—I have an engagement elsewhere.'

'An engagement, father! You have an engagement! And in Oxford, too,' Dick faltered out. 'Why, how on earth can you have managed to pick up an engagement?'

Mr Plantagenet drew himself up as he was wont to do for the beginning of a quadrille, and assuming an air of offended dignity, replied with much hauteur: 'I am not in the habit, Richard, of accounting for my engagements, good, bad, or indifferent, to my own children. I am of age, I fancy. Finding myself here at Oxford in a congenial society—in the society to which I may venture to say I was brought up, and of which but for unfortunate circumstances, I ought always to have made a brilliant member—finding myself here in my natural surroundings, I repeat, I have of course *picked up*, as you coarsely put it, a few private acquaintances on my own account. I'm not so entirely dependent, as you suppose, upon you, Richard, for my introduction to Oxford society. My own personal qualities and characteristics, I hope, go a little way at least towards securing me respect and consideration in whatever social surroundings I may happen to be mixing.' And Mr Plantagenet shook out a clean white cambric pocket-handkerchief ostentatiously, to wipe his eyes, in which a slight dew was supposed to have insensibly collected at the thought of Richard's unfilial depreciation of his qualities and opportunities.

'I'm sorry I've offended you, father,' Dick answered hastily. 'I'm sure I didn't mean to. But I do hope—I do hope, if you'll allow me to say so, you're not going round to spend the evening—at any other undergraduate's rooms—not at Gillingham's or Faussett's.'

Mr Plantagenet shuffled uneasily: in point of fact, he looked very much as he had been wont to look in days gone by when the landlady at the *White Horse* inquired of him now and again how soon he intended to settle his little account for brandy and sodas. 'I choose my own acquaintances, Richard,' he answered with as much dignity as he could easily command. 'I don't permit myself to be dictated to in matters like this by my own children. Your neighbour Mr Faussett appears to me a very intelligent and gentlemanly young man: a young man such as I was accustomed to associate with, myself, in my own early days, before I married your poor dear mother: not like *your* set, Richard, who are far from being what I myself consider thoroughly gentlemanly. Mere professional young men, your set, my dear boy: very worthy, no doubt, and hard-working, and respectable, like this excellent Gillespie: but not with that *cachet*, that indefinable something, that invisible hallmark of true blood and breeding, that I observe with pleasure in your neighbour Faussett. It's not your fault, my poor boy: I recognise freely that it's not your fault. You take after your mother. She's a dear good soul, your mother'—pocket-handkerchief lightly applied again—

'but she's *not* a Plantagenet, Richard: she's *not* a Plantagenet.' And with this parting shot neatly delivered point-blank at Dick's crimson face, the offended father sailed majestically out of the room and strode down the staircase.

Dick's cheek was hot and red with mingled pride and annoyance; but he answered nothing. Far be it from him to correct or rebuke by word or deed the living head of the house of Plantagenet.

'I hope to God,' he thought to himself, piteously, 'Faussett hasn't asked him on purpose to try and make an exhibition of him. But what on earth else can he have wanted to ask him for, I wonder?'

At that very same moment Faussett was stopping Trevor Gillingham in the Chapel Quad with a characteristic invitation for a wine-party that evening. 'Drop in and have a glass of claret with me after Hall, Gillingham,' he said, laughing. 'I've got a guest coming to-night. I've asked Plantagenet's father round to my rooms at eight. He'll be in splendid form. He's awfully amusing when he talks at his ease, I'm told. Do come and give us one of your rousing recitations. I want to make things as lively as I can, you know.'

Gillingham smiled the tolerant smile of the Born Poet. 'All right, my dear boy,' he answered. 'I'll come. It'll be stock-in-trade to me, no doubt, for an unborn drama. Though Plantagenet's not half a bad sort of fellow, after all, when you come to know him, in spite of his mugging. Still, I'll come, and look on: an experience, of course, is always an experience. The poet's life must necessarily be made up of infinite experiences. Do you think Shakespeare always kept to the beaten path of humanity? A poet can't afford it. He must see some good—of a sort—in everything; for he must see in it at least material for a tragedy or a comedy.' With which comfortable assurance to salve his poetical conscience, the Born Bard strolled off, in cap and gown, with an easy lounging gait, to evening chapel.

THE MOTHER OF NAPOLEON.

LETITIA RAMOLINI, the Mother of Napoleon Bonaparte, was born at Ajaccio on the 24th of August 1750. She was celebrated throughout the island of Corsica for her beauty, and was married to Charles Bonaparte before she had completed her sixteenth year.

The picturesque island of Corsica was formerly a province of Italy, and was Italian in its language, sympathies, and customs. In the year 1767 it was invaded by a French army, and, after several conflicts, its inhabitants were forced to yield to superior numbers, and Corsica was annexed to the empire of the Bourbons. At the time of the French invasion, Charles Bonaparte, a handsome lawyer, of vigorous intellect and of Italian extraction, abandoned the profession of the law for the sword, and united with his countrymen, under General Paoli, in their endeavours to resist the invaders. He and Letitia had then one child, Joseph; and the young wife

accompanied her husband on horseback in his dangerous journeys, and rode by his side and shared all the perils by which they were surrounded. High-spirited and brave, with a strong will, the beautiful young woman appears to have set an example of almost Spartan endurance.

Eight weeks after the island had been transferred to the dominion of France, Napoleon was born at Ajaccio, on the 15th August 1769. Singularly enough, considering the future that lay before him, his birth took place under a canopy of tapestry representing the heroes of the *Iliad*.

Letitia's husband died not many years after the birth of Napoleon. He is said to have appreciated his son's powers, which even then were remarkable. Madame Bonaparte was left a widow at the age of thirty-five, with eight children, five sons and three daughters. In her husband's lifetime, before their troubles came, she had been a wealthy woman, but now her means were limited. She retired with her children to her country home, a residence approached by an avenue overarched by lofty trees and bordered by flowering shrubs. A smooth snug lawn was a pleasant playground for the 'embryo kings and queens' who called Letitia mother. Napoleon afterwards repeatedly declared that the family were entirely indebted to her for that physical, intellectual, and moral training which prepared them to rise to the summits of power to which they afterwards attained. He often said: 'My opinion is, that the future of a child for good or evil depends entirely upon its mother.'

Speaking of the death of an uncle upon whom the children were partly dependent, and of his mother's life in her early widowhood, Napoleon said: 'He [the uncle] then made us draw near, and gave us his blessing and advice. "You are the eldest of the family," he said to Joseph, "but Napoleon is the head of it. Take care to remember what I say to you." He then expired, amidst the sobs and tears which this melancholy sight drew from us. Left without guide, without support, my mother was obliged to take the direction of affairs upon herself. But the task was not above her strength. She managed everything, provided for everything with a providence which could neither be expected from her sex nor from her age. Ah! what a woman! Where shall we look for her equal? She watched over us with a solicitude unexampled. Every low sentiment, every ungenerous affection, was discouraged and discarded. She suffered nothing but that which was grand and elevated to take root in our youthful understandings. She abhorred falsehood, and would not tolerate the slightest act of disobedience. None of our faults were overlooked. Losses, privations, fatigue, had no effect upon her. She endured all, braved all. She had the energy of a man, combined with the gentleness and delicacy of a woman.'

Abbott tells the following anecdote, which shows how firm was the rule of the good, high-minded mother. 'A bachelor uncle owned the rural

retreat where the family resided. He was very wealthy, but very parsimonious. The young Bonapartes, though living in the abundant enjoyments of all the necessities of life, could obtain but little money for the purchase of those thousand little conveniences and luxuries which every boy covets. Whenever they ventured to ask their uncle for coppers, he invariably pleaded poverty, assuring them that though he had lands and vineyards, goats and poultry, he had no money. At last the boys discovered a bag of doubloons secreted upon a shelf. They formed a conspiracy, and by the aid of Pauline, who was too young to understand the share which she had in the mischief, they contrived, on a certain occasion when the uncle was pleading poverty, to draw down the bag, and the glittering gold rolled over the floor. The boys burst into shouts of laughter, while the good old man was almost choked with indignation. Just at that moment Madame Bonaparte came in. Her presence immediately silenced the merriment. She severely reprimanded her sons for their improper behaviour, and ordered them to collect again the scattered doubloons.'

Napoleon was not an amiable child; he was silent and retiring in disposition; melancholy, too, and impatient of restraint. Many years afterwards, an isolated granite rock of wild and rugged form, within which was something resembling a cage, in the grounds of his early home, was pointed out as having been his favourite resort as a child, and it still bore the name of 'Napoleon's Grotto.' There, whilst his brothers and sisters were at play, he would recline for hours, book in hand, looking out upon the broad expanse of the Mediterranean, and on the blue sky overhead. At other times, his favourite plaything was a small brass cannon, weighing about thirty pounds. He delighted to hear its loud report, and to imagine he saw whole squadrons mown down by its discharges.

Abbott says the little boy 'loved to hear from his mother's lips the story of her hardships and sufferings, as, with her husband and the vanquished Corsicans, she fled from village to village, and from fastness to fastness, before their conquering enemies. The mother was probably but little aware of the warlike spirit she was thus nurturing in the bosom of her son; but with her own high mental endowments, she could not be insensible to the extraordinary capacities which had been conferred upon the silent, thoughtful, pensive listener.'

When Napoleon was about ten years of age, Count Marbeuf obtained admission for him to the Military School at Brienne, near Paris. Forty years afterwards, Napoleon observed that he should never forget the pang he felt when parting with his mother. Stoic as he was already, his stoicism forsook him, and he wept like any other child. He remained at this school five years, during which his holidays were spent at Corsica; then he was promoted to the Military School at Paris. Afterwards he entered the army, and there his upward progress was rapid.

During the disturbances which took place in the island of Corsica in the year 1793, Napoleon happened to be on a visit to his mother; and when Paoli—dissatisfied with the excesses of the

French Convention, under which he then ruled the island—determined to surrender Corsica to the English, the Bonaparte family became head of the French party. Napoleon had tried all his powers of persuasion to induce the old friend who had been his hero in more youthful days to adopt a different line of conduct, but in vain. Paoli, the veteran General, was eighty years of age; and being firmly convinced that he was right in his determination, it was not likely that he would yield to Napoleon, who was then only twenty-four. The friends parted sorrowfully, and civil war began. Paoli's side soon became the stronger, as increasing numbers of English flocked to his standard. Napoleon saw that it was useless to attempt further resistance, and that he and his family could no longer reside safely in Corsica. Sorrowfully he disbanded his forces and prepared to leave the island.

Paoli called upon Madame Bonaparte, and endeavoured to persuade her to induce her family to join him in the treasonable surrender of the island to the English, urging that resistance was hopeless, and, by perverse opposition, she was bringing irreparable ruin and misery on herself and family; upon which Napoleon's mother rejoined: 'I know of but two laws which it is necessary for me to obey—the laws of honour and of duty.' A decree was immediately passed that the family must be banished from Corsica.

One morning Napoleon hurried to inform his mother that several thousand peasants were coming to attack the house. Hastily seizing such articles of property as they could take with them, the family fled precipitately, and for several days wandered, homeless and destitute, about the seashore, until Napoleon could make arrangements for their embarkation. Their house was sacked by the mob and their furniture destroyed.

It was a touching scene when at midnight an open boat, manned by four strong rowers, approached the shore near Madame Bonaparte's plundered dwelling, and, whilst an attendant held a lantern, the poor exiled family sorrowfully and in silence entered the boat. A few trunks and bandboxes contained all their available property. The oarsmen pulled out into the dark and lonely sea. 'Earthly boat,' says Abbott, 'never before held such a band of emigrants. Little did those poor and friendless fugitives then imagine that all the thrones of Europe were to tremble before them, and that their celebrity was to fill the world.' And in the flight, as henceforward in their lives, Napoleon was the commanding spirit.

Madame Bonaparte first settled at Nice, and afterwards at Marseilles, where she and her family resided in much pecuniary embarrassment until relieved by Napoleon's rising fortunes.

When the new government of France, called the Directory, was established, Napoleon, unanimously applauded for having saved the Republic by his energy, was appointed Commander-in-chief of the Army of the Interior. He was then only twenty-five; and he had, by the force of his genius and the extraordinary exertions he had made, attained to a very elevated position in the eyes of the French nation.

His first step spoke well for his filial devotion. The historian above quoted says: 'Immediately

upon the attainment of this high dignity and authority, with the ample pecuniary resources accompanying it, Napoleon hastened to Marseilles to place his mother in a position of perfect comfort. And he continued to watch over her with most filial assiduity, proving himself an affectionate and dutiful son. From this hour the whole family, mother, brothers, and sisters, were taken under his protection, and all their interests blended with his own.'

At the age of twenty-six, Napoleon was placed by those in command at the head of the Italian army. There, in the midst of many temptations, he appears to have pursued, as he himself said, 'a line of conduct in the highest degree irreproachable and exemplary. In spotless morality I was a Cato, and must have appeared so to all. I was a philosopher and a sage. My supremacy could only be retained by proving myself a better man than any other man in the army. Had I yielded to human weaknesses, I should have lost my power.' Abbott says that Napoleon at that time was temperate in the extreme, seldom allowing himself to take even a glass of wine, and never countenancing by his presence any scene of bacchanalian revelry. 'For gaming in all its branches he manifested then and through the whole of his life the strongest disapproval. From what source did the young soldier imbibe these elevated principles? Napoleon informs us that to his mother he was indebted for every pure and noble sentiment which inspired his bosom.'

Public attention does not seem to have been directed towards Napoleon's mother until her son was proclaimed Emperor in 1804. She then received the title of Madame Mère, and an income of a million francs was settled upon her. And that she might have a position of political importance, she was made Protectrice-Générale of all the charitable institutions of France. Such an office admirably suited her. She frequently solicited favours of her son for others, and was happy whenever her exertions met with success. On one occasion, upon learning of the arrest of the Duke d'Enghien, she even threw herself upon her knees before Napoleon, imploring mercy for the unfortunate Prince. In her tender anxiety, she thus laid aside that habitual dignity which the following incident illustrates. Soon after Napoleon's assumption of the imperial purple he chanced to meet his mother in the gardens of St-Cloud. He was surrounded by courtiers, and half playfully held out his hand for her to kiss. 'Not so, my son,' she gravely replied, at the same time presenting her hand in return; 'it is your duty to kiss the hand of her who gave you life.'

After this, it seems a pity that truthfulness must make us say that even this great woman had one littleness, if we may call it so, of character. She evinced sometimes a resemblance to the brother, whose parsimony her sons had resented in their childhood, by showing a love of economising, even upon trifling occasions. This proved a source of frequent amusement amongst the gay circles of Paris. The Emperor himself was sometimes a little scandalised at her actions, although this did not hinder him from most highly respecting her character.

Mrs Ellis says: 'Many curious instances are recorded of Madame Letitia's love of hoarding;

for which, however, she had, or thought she had, her own sufficient reasons. Indeed, it is impossible to calculate the effect to which her own mind may have been early impressed by circumstances with the convictions of the uncertainty of that success which her sons had so unexpectedly attained. To the mother who had watched over their deserted childhood—who had learned in her widowed state what it was to have scarcely any human friend on whom she could depend for advancing her sons in the career of worldly distinction; and who, with her young family around her, had experienced all the anxieties of being driven from her native country and cast upon a world of strangers—to her there must have appeared but an uncertain foundation for confidence in the sudden and unprecedented exaltation of her sons. And then, “if reverses should come,” who can wonder, with this experience so deeply impressed upon her memory, that her imagination should have been haunted with apprehensions, which in their mode of exhibition appeared, to those who were but superficial observers, something like the manifestations of an amusing kind of mental aberration. Under these impressions she is said to have replied to those who remonstrated with her for her parsimony: “Who knows but I may one day have to provide bread for all these kings!”

Mrs Ellis goes on to say: ‘But this peculiarity of Madame Letitia’s can the more easily be forgiven when it is remembered how faithful and unceasing were the efforts she employed for serving the interests of her sons; and especially how liberal were her offers of assistance when the tide of fortune had set against them. When all her sons except one were seated on thrones, she was unceasing in her applications to the most powerful of them on behalf of Lucien. On being one day told by Napoleon that she loved Lucien more than she did the rest of her family—‘The child,’ she replied, ‘of whom I am the most fond is always the one that happens to be the most unfortunate.’

Madame Mère is said by one who saw her late in life to have been then a pale, earnest-looking woman, who, after speaking of anything which interested her much, sat with compressed lips and wide open eyes, an image of firmness of purpose combined with depth of feeling. At other times, ‘her soul beamed in her looks, and it was a soul full of the loftiest sentiments.’ The same writer (the Duchesse d’Abrantès) thus describes her at another period: ‘The revolution of the 8th was completed, and Paris was no longer agitated. We went to see Madame Letitia Bonaparte, who then lived with Joseph. She appeared calm, though far from being at ease, for her extreme paleness, and the convulsive movements she evinced whenever an unexpected noise met her ear, gave her features a ghastly look. In these moments she appeared to me truly like the mother of the Gracchi. And her situation gave force to the idea; she had perhaps more at stake than that famous Roman matron.’

It was only natural that the tenderness of such a mother should have been nobly shown to her son when reverses came upon him and his wonderful fortunes changed. She, who always thought most tenderly and with the greatest love of that one of her children who was in adversity,

followed the banished Emperor to Elba, and, with a few attendants, took up her residence there. Mrs Ellis says: ‘From the earliest period of his reverses, the mother’s heart with all its warmest affections became especially centred in the son. She had often reproved him for his pride and ambition in the days of his prosperity, and at that time she was perhaps the only friend in existence from whose lips he had heard the truth; but from the time of his overthrow at Waterloo to the day of his death, her true woman’s heart never swerved from this one object of all her deepest and most absorbing interests. Again and again she offered him all that she possessed in the world, to assist in the re-establishment of his affairs. “For me,” said Napoleon, in his last exile, when memories of the past so often filled his mind, “my mother would without a murmur have doomed herself to live on brown bread. Loftiness of sentiment still reigned paramount in her breast; pride and noble ambition were not yet subdued by avarice.”’

This brave, devoted woman also thus appealed to the allied sovereigns at Aix-la-Chapelle on his behalf: ‘Sires, I am a mother, and my son’s life is dearer to me than my own. In the name of Him whose essence is goodness, and of whom your Imperial and Royal Majesties are the image, I entreat you to put a period to his misery, and to restore him to liberty. For this I implore God, and I implore you, who are his vice-gerents on earth. Reasons of state have their limits; and posterity, which gives immortality, adores above all things the generosity of conquerors.’

Again, in 1819, Napoleon’s mother cheerfully defrayed the expenses of sending to St Helena qualified persons, selected by her brother, Cardinal Fesch, with the approval of the Pope, to minister to the body and soul of her unhappy son. She herself outlived her illustrious son, dying when nearly eighty years of age, and retaining to the last much of her beauty of person and extraordinary vigour of mind.

BABY JOHN.*

CHAPTER V.—GOOD-BYE.

‘Tis sweet to know there is an eye will mark
Our coming, and look brighter when we come.

BYRON.

‘HE’S coming here to-morrow!’ It was the end of May, and Baby John Craddock was close on three months old, and Alice and Lucy were seriously considering the necessity of short-coating him. ‘A great, big, fat boy, growing out of all his clothes shameful!’

Life had run on so brightly and smoothly, that it had seemed as if it might run on the same for ever, and Alice had ceased to talk of going back to the mill, or Lucy to be on the lookout to stop her from doing so. But here, all of a sudden, a cloud appeared which threatened to darken the brightness of their day—a rock which might turn the peaceful sunny stream into new ways, stony and troubled.

* Copyright 1892 in the United States of America by Roberts Brothers.

'He's coming here to-morrow!'

'To fetch you home?'

'No, he don't say so.' Lucy went reading on; writing was not very easy for her to decipher, and her husband's hand was especially difficult to her.

Alice was giving Baby John his bottle, so did not pay much attention, till she heard Lucy give a cry of surprise and rather awe-stricken delight.

'What is it?'

'Oh, Alice, what do you think? As far as I can make out, he's got to go to America for six months on business, and he wants to know if I'd like to stop on here with you while he's gone? Here, just you take the letter and see what you make of it, and give me baby.'

Yes; there was no mistake about it. Alice spelt it out to the same effect. Mr Craddock was obliged to go to America on important business, which might take him as long as six months. During his absence he was going to leave the mill under the care of a cousin of his, and he asked if Lucy would prefer to return to Felsby or remain at Beston, or— There was evidently another alternative in his mind, but the second 'or' had been scratched out, as if it were not worth while to suggest it.

Alice sat for a minute or two with her eyes fixed on that scratched-out 'or,' and when she looked up, there was an absent look on Lucy's face, as if she, too, were pondering something; and she caught the baby up in her arms and held it tightly against her breast, thereby interfering with that individual's enjoyment of the pipe of peace—in his case represented by his bottle—and producing a squall of remonstrance.

'What was he going to say there?' Alice asked, pointing to the scratched-out word.

'I don't know. What could one do except go back to Felsby or stop here? And of course, of course, of course we'll stay here, all through the summer! Six whole lovely months—June, July, August, September, October, November.' Lucy reckoned them off on the fat little fingers of Baby John, which were more generally used to illustrate 'This little pig went to market.'

'It's a long time,' Alice said, 'and'—

'Lovely and long!' Lucy interrupted. 'Why, Alice, I don't believe you're half as pleased as I am. You're tired of me and baby, and the sea, and the flowers, and want to go back to nasty, smoky, old Felsby!'

Alice felt that it was not really worth while to contradict such a ridiculous accusation as this, but she was strangely silent and thoughtful all that day; and Lucy, too, though she kept up rattling talk, and planned what they would do, would drop now and then into a wistful, uneasy silence, and her laughter and gaiety had a strained effect, as if they were not altogether natural.

Mr Craddock had not said what time he would arrive, so the girls began expecting him at the very earliest hour in the morning, not reckoning

that this would have necessitated his leaving Felsby about midnight. They could neither of them eat any breakfast, and they started at the slightest sound, thinking it was his arrival.

Except in the matter of extra care in the appearance of Baby John, Lucy refused to make any preparations for her husband's visit, and did not even tell Mrs Tripp he was coming.

'He'll bide the night, won't he?' Alice asked. 'There's a room in next door that I knows I can have for the night, so don't think about me. I knows how to make myself scarce, and I'll go right off when I see him coming, so as you can be all to yourselves.'

But Lucy would not hear of such a thing. 'If he bides the night, he can just go to the *Seaview*, and he'll dine there, so don't bother your head about getting anything extra in. He'd think this a horrid, pokey, little place, and baby'd worry him, and he'd a lot rather be by himself, and Mrs Tripp's cooking's well enough for us, but it wouldn't suit him.'

'Do he think a deal of what he eats and drinks?'

'Oh no, he ain't that sort at all, he's easily pleased; but there! he's used to having things nice, and I don't care that he should be put about more than I can help along of me.'

He did not actually arrive till the afternoon, and as soon as he came, Alice slipped away, and went for a long walk along the cliffs, hardly noticing all the beautiful colours on the sea, or the vivid green of the new springing grass on the downs, so full was her heart of Lucy and Baby John, and Baby John's father.

She did not come back till nearly seven, and then was planning a visit to a rheumatic old fisherman, whose acquaintance they had made on the beach, so as not to intrude on the privacy of the husband and wife. But before she reached Beston, she met Lucy with the baby in her arms coming out to meet her.

'Why, wherever have you been? I knew you was coming this way, and I've been waiting about for more than an hour, thinking you were bound to be back soon. And you've tired yourself to death. No, you shan't carry baby; you look as if you could hardly carry yourself, and you ain't had no tea. I gave baby his before I started out, and had a cup myself; but I told Mrs Tripp to have the kettle on, as you'd be sure to be in soon, and we'd all have tea together.'

'He didn't stop long, then?'

'No, I could have told you he wouldn't before he came. He's gone to the *Seaview* to have his dinner, and he won't trouble to come in again this evening, for I told him we was early going to bed; but perhaps he may look in to-morrow before he starts.'

'He's going to-morrow?'

'Yes, he's off to America next week; so, of course, he's terrible busy settling everything before he goes.'

'Did he think baby grewed?'

'He didn't take much notice of him. He just poked his cheek with his middle finger—don't you know how men do? and he said he was very small, as if he weren't a big, fine boy for his age.'

'What did he say about the name? Were he pleased?'

'Oh, there! I don't know. I told him as I'd called him after my father, and he didn't make no remark.'

'Did he say anything?'—

'No, not a word. I knew he'd not think of such a thing.'

Neither of the girls had ever said a word to one another of what had been in their minds since Mr Craddock's letter came the day before, which was that the other alternative was for Lucy to go with him to America; and yet Lucy understood Alice's question before it was finished, and Alice understood the answer, vague as it was.

They had to pass the *Seaview* to reach their lodgings. The season at Beston, as I have said, had not begun, and the *Seaview*, at the best of times never a very imposing place, had the desolate air of a hotel out of season. Some repairs were being done, and ladders were reared against the front, and the door was in the first stage of painting, when big blotches of vermilion adorn it. In the bow-window of the coffee-room a solitary figure was sitting at dinner with a newspaper propped up on the cruet-stand in front of him, waited on by a dirty-looking maid, as the waiter was only engaged for the season, and the hotel was generally out of gear. The girls hastened their steps as they went by, but he seemed absorbed in his newspaper, and did not notice them.

'Don't he look lonesome?' Alice said, with compunction.

'Oh, he don't mind, bless you! It's what he's been used to, and he's one of them as likes his own company best.'

At Mrs Tripp's tea was ready on the table, very humble, but clean and cheerful looking, with a little bit of fire lighted, the evenings being chilly, though the days were so warm and bright, and a kettle steaming away on the hob, and the girls' frugal meal spread out on a white cloth, and the baby's bassinette in a warm corner by the fire.

'Don't it look snug?' Lucy said as they came in; and both of them thought involuntarily of the lonely figure in the *Seaview* coffee-room.

That room made a pretty picture half an hour later to any one standing in the road, for the girls had forgotten to draw down the blind, there were so few passers-by, and the little garden, full of thrift and wall-flower in between, prevented any sense of publicity. The tea-table had been pushed back, and Lucy sat in a low chair in front of the fire, with her sleeves rolled back and a large flannel apron on, on which was Baby John, just out of his bath, kicking and crowing in the delightful freedom from the trammels of clothing. Any woman might have looked beautiful in such circumstances; even Alice's sharp, little, plain face was glorified almost into loveliness as she knelt in front, doing homage to the young divinity; but Lucy's young face, with the warm colour in the cheeks, and the hair in soft, curling untidiness, and the big eyes full of mother's love, seemed to some one looking in from the road outside, the sweetest sight possible to imagine.

For there was a looker-on. Mr Craddock had found the mouldy quiet of the *Seaview* inexpressibly dreary, and had turned out to smoke, and involuntarily had turned his steps in the direction of Mrs Tripp's. He had no idea of going in; he

had understood Lucy's hint about their going to bed early; and yet there was something that made him almost inclined to go—the baby that he had taken so little notice of, and the baby's name, which Lucy had taken such pains to tell him had been given from her father. He felt as if Baby John gave him a claim to a corner in that bright little room, and almost ensured him a welcome.

Perhaps the fixedness of his gaze made itself felt, as I believe a very earnest look will sometimes, for Lucy suddenly became aware that the blind was not drawn down, and she asked Alice to do it.

'I thought there was some one looking in.' And then the blind was drawn down, and Mr Craddock turned away to his hotel.

The girls were at breakfast next morning when the little shabby hotel omnibus pulled up in front of the house (not that it took much pulling to stop the horse, which had been drawing seaweed all the week), and Mr Craddock came into the room before Alice could escape, so she was unwillingly obliged to be present at the parting of husband and wife.

'I've only a minute to spare,' he said, 'before the train, but I thought I'd look in to say good-bye.'

There was almost an apologetic tone in his voice, and Alice—who, it need hardly be said, was heart and soul on Lucy's side, and would have maintained through thick and thin that if there was anything unsatisfactory in the relations between them, it was altogether his fault—now felt a little vexed at Lucy's want of readiness to reply.

'I hope you'll be all right while I'm away,' he went on, his voice getting more business-like. 'I've told George Mills to keep you supplied with money, and if you want more you must let him know, and he'll send you a cheque. He'll be writing to me every week on business, so he'll let me know how you get on, and if you've any message to send he'll forward it. Well, I mustn't stop, or I shall miss the train. Good-bye! I suppose the baby's asleep, isn't it?'

Alice would have roused Baby John from the sweetest slumbers, even at the risk of injuring his precious health; but perhaps that unfortunate 'it' offended his mother's ear, for she only drew back the quilt and showed Baby John's fat cheek deep in the pillow.

'Yes, he generally has a nap after he's dressed of a morning,' she said.

Then there was an awkward pause, and then Mr Craddock turned and held out his hand to Alice. 'I'm glad you'll be able to stop with Lucy and the boy while I'm away,' he said.

And Alice put her little, rough, hard-worked hand into his very heartily. 'I'll see after them both my very best, never you fear!' And she found she had tears in her eyes, and a hard matter to steady her voice.

And then he kissed Lucy and was gone; and there was the bang of the omnibus door, and the jingle of the harness and crack of the whip, and Alice drew back the curtain to look after it as it moved off.

'Will you have some more tea?' Lucy said, with an immense struggle after composure and indifference, with a trembling hand pouring the

tea into the sugar-basin; but the next minute Alice was cramming Lucy's hat on her head anyhow, wrong side in front, and pulling and pushing her towards the door.

'Run, run!' she was sobbing out, 'as quick as ever you can go; the short way behind the *Anchor*, you know! You'll be in time to catch him if you look sharp!'

'Well,' Alice asked, half an hour later, when Lucy came slowly back in very different style from the wild, breathless rush she had made when she left the house, 'were you in time?'

Lucy nodded. 'The train was just in, and he looked quite startled to see me, and I were that out of breath I could hardly speak; but I said as I'd come to see him off and say good-bye. He didn't say much, but I think he were pleased, and I'm glad I went; but it was all your doing, Alice; I'd never have gone if it hadn't been for you.'

CHAPTER VI.—A BRIGHT FUTURE.

She lived unknown, and few could know
When Lucy ceased to be;
But she is in her grave, and, oh,
The difference to me!—WORDSWORTH.

John Craddock thought a great deal of that parting with his wife. He was not at all inclined to be sentimental; he was a very matter-of-fact and business-like man, and it would have astonished some of his business friends, who accounted him more hard and sensible than he really was, if they had known how often, even in the middle of business talk, the thought of his young wife as he had seen her last at Beston Station, with flushed cheeks and bright eyes and ruffled hair, panting out her farewell words, came before his mind's eye, pleasanter even to remember than the scene of the evening before, which he had contemplated through the window.

He had grown to think, during those months since his marriage, that it had been an entire and unmitigated mistake; and that the only thing now was to make the best of a hopelessly bad job, and rub along with as little friction as possible. But, somehow, those few hours at Beston, and the sight of Baby John and Lucy coming to the station, the first act of spontaneous affection he ever remembered her to have shown (he did not know that even this had been proposed by Alice), seemed to suggest a possibility of something better and brighter and sweeter, a possibility of a wife who might learn to love him, to brighten when he came, to be sorry when he left her, instead of that dreary mutual endurance which had seemed the only prospect to the end of the chapter—a possibility of a home where he would be welcome, and whose brightness he would not cloud, nor have to stand outside in the darkness alone. That little mill-girl, Alice Reynolds, was a good sort, and he had made a mistake in separating Lucy from her. 'When I go back to England,' he used to tell himself, 'it shall be different;' and by-and-by he used to say, 'When I go home,' and the home he thought of was not Apsley Villa, with all its comfort and respectability, but that little room at Beston with Lucy sitting in the firelight, with Baby John upon her lap.

More than once during those sultry summer months in New York, he had made up his mind

to write to her, to say he was sorry for what was past, and anxious, when he came home, to try to make her happier and win her love; but he was only used to writing business letters, and was as shy as any school-girl or bashful youth of writing love letters even to his wife. And besides he knew what pain and grief it would be to her to answer it, and how the difficulties of spelling and writing would cramp all the natural expression out of it. No, he would wait till he went home, and then, with Baby John between them, it would not be so hard to explain.

Those months seemed interminable. The business that would at one time have been of enthralling interest seemed wearisome and irritating, though it proved, from a money point of view, more remunerative than he anticipated. Every week brought him satisfactory letters from Felsby, where all was going well and smoothly in his absence. Occasionally his manager mentioned having heard from Mrs Craddock, acknowledging or asking for remittances, and that he was glad to hear she and the baby were in good health; but as he never imagined that this could be the only communication between husband and wife, parted for six months, he only put it in as a matter of form, and very often omitted any mention of her, though Mr Craddock tore open his letters and scanned them eagerly for just this poor, little, meagre information.

But those months which Lucy had counted so gaily on baby's fat, little fingers—June, July, August, September, October, November—had more than half gone; August's long, dusty days had drawn to an end, and Mr Craddock was beginning to let himself count the days to his return, which, if everything went favourably, might be almost a month before he had calculated. He would not, however, even hint at such a possibility in writing home to his mother or his manager, lest Lucy should hear of it, and be disappointed if there were any unforeseen delay. Would she be disappointed? Oh dear! how much he had built on those very slight foundations—that impulsive run to the station to bid him good-bye, that baby named after himself.

But it took even him by surprise when one day, at the beginning of September, he found himself at the end of his business, and free to go back to England by the next steamer if so minded. There was a steamer advertised to start the next day, and he went straight to engage his passage, and spent the rest of the day in buying presents to take home. What would she like best? Anything for the boy, he felt safe about that; and next, something for Alice. He felt shy of taking Lucy trinkets, remembering many such he had given her to make the peace after some painful scene of irritable impatience on his part, and how she had received them with hardly veiled indifference, and never cared to wear them.

But it was to be different now, and so he encouraged himself to buy a pair of earrings which took his fancy in a shop. While he was choosing them, he came across a man whose acquaintance he had made in business, who looked surprised and rather amused at seeing this grave, grizzled, middle-aged Englishman spending so much time and not a little money over these earrings; and Mr Craddock found himself confiding to this

stranger, in a manner totally unlike his usual reserved habit, that he was going home to his wife, and wanted to take her a present.

He got them out that evening at his hotel to look at them, wondering if she would like them, and if she would let them take the place of those common little earrings that she prized so much, and which at one time he had suspected of being a gift of some former admirer, till it came out accidentally that they had been given her by Alice. He was just putting them back into the jeweller's box with a ridiculously sentimental memory of Lucy's little ear and the soft curls of hair round it, when a knock came at the door and the boy brought in a telegram.

He opened it without much interest, with merely a passing fear that it might delay his departure, and a resolution that he would not allow it to do so. It was from George Mills: 'Deeply regret to inform you Mrs Craddock died this morning at Beston. Wire instructions as to funeral.'

He sat looking at the telegram full ten minutes before he realised what it meant. He even opened the jeweller's little box again, and took out one of the earrings and held it up to the light, and went on in a dull sort of way with the thought of how it would look in Lucy's ear. It was impossible! He remembered how she looked as the train left the platform, with her bright, young face, and her hair ruffled by the speed with which she had come, and her eyes bright, and her lips parted with her breathless words, full of life to her finger-tips. And the night before, as she sat in the firelight with Baby John, a picture of sweetest motherhood, so young and strong and bright, why, by the side of Alice, she looked the very picture of health! And that was the end of it all! Never to tell her he was sorry, to try to make amends, to win her to look at him without the fear in her young eyes, to speak to him without the constraint in her voice. If she had died in the beginning of the year, when Baby John was born, it would not have been so hard. He had been anxious and deeply distressed then; he had felt bitter regrets at the failure of their short married life, and had accused himself of the fault being his, and of being greatly to blame; but he had not thought then of the possibility of anything better and happier—it was only the end of a grievous mistake, not the shattering of bright hope for the future, as it was now.

All through the night he paced up and down his room, dreading plucking up the little flowers of hope that had been growing so sweetly since he left England. He was not naturally a hopeful man; he had not the sanguine nature some possess, which fills the future with bright-coloured possibilities, which, though they are constantly dashed to the ground, are as often renewed. These sanguine people get a great deal of happiness out of life, and if they are continually disappointed, the disappointment is not deeply rooted. But with natures like John Craddock's it is almost a mortal wound when a hope has been rooted up; the poor heavy soil of such hearts bears no more gay blossoms or tender leaves ever again.

The boat was to start at six o'clock next morning, and when the early call came to his door,

John Craddock was ready, and his portmanteau packed. Before he left the hotel he wrote a telegram to George Mills: 'Funeral at Beston. Make all arrangements.'

CURIOSITIES OF SUPERSTITION.

In the bardic legends and old folklore of Ireland we now and then meet with a paragraph or a phase of national character which arrests our thoughts. Much there may be to feed and stimulate the enthusiasm of the ardent searcher after the mystic and the weird; but the ordinary mortal of hard work-day life may be thankful if chance throw a few items in his way without having first to glean them out of the obscure notes and the long, dull, heavy pages of prosy compilations.

Like some other nations, the Irish invested even the lowest forms of animal life with the power of exercising no small influence on the actions and destinies of men. The *Dara Deil* (*Forficula oleus*, or 'black devil'), an insect of the earwig class, used to be an object of almost universal abhorrence; yet its services were sometimes availed of in labour which demanded extraordinary physical exertion. In creeping along, whenever it hears any noise it always halts, cocks up its tail, and jerks out its sting, which is similar to that of a bee. No reptile has been so much abhorred and dreaded by the peasantry as the 'black devil,' as it used to be commonly believed that this insect betrayed to his Jewish enemies the way in which the Saviour went when leaving the city of Jerusalem. It was no small gain to destroy this insect; for seven sins, it was said, were taken off the soul of the slayer. The people believed the sting of the *Dara Deil* to be very poisonous, if not mortal, and that it possessed a demoniac spirit. Under this impression, whenever it is seen in a house by the peasantry, they always destroy it by placing a coal of fire over it; and when burnt, the ashes are carefully swept out. It is not trodden on by foot, as a less formidable insect would be; nor is it killed by a stick, for it is believed that the poisonous or demoniac essence would be conveyed to the body of the slayer through leather or wood. It has often been related that labourers have been enabled to perform extraordinary feats through the agency of the black devil, which they insert in some part of the implements of their labour; but the few who were so daring as to have recourse to such means were regarded as dabblers in the black art, and were looked upon as reckless, as 'utterly left to themselves,' and almost beyond the pale of salvation. This insect is still considered exceedingly dangerous; it is thought to be a kind of scorpion; but very few indeed are now disposed to lift it to the dignity of preternatural influence.

The cuckoo is associated with ideas of a milder character. When first heard, in whatever quarter you are looking, in that direction you are to live

the rest of the year ; but the distance is indefinite ; it may be a mile, or it may be a hundred miles, and there is always a large margin allowed on either side the line, which gives easy fulfilment to the prediction. This happy arrangement leaves plenty of space for coincidence, and gives the cuckoo a long lease of prestige and importance.

The cat, so intimately associated with the idolatry of Egypt, was not likely to be forgotten in the fetichism of Celtic mythology. The preternatural attributes said to be ascribed to it by the Druids have outlived the Druids, their rites and their systems, and have come down to us refined and mellowed by the lapse of centuries. Cæsar Otway, a diligent gleaner of the reliques of ancient Irish superstitions, has preserved in his *Erris and Tyravley* some notable instances of the weird character and magical influence of this mysterious animal. He says : 'Cats are supposed to be but too often connected with witchcraft, and to lend their outward forms to familiar spirits. The timorous respect persons have for them is increased by the fact of their frequent meetings, to which they come from a distance of seven or eight miles ; and from fifty to sixty are often in the assembly. The parliament is generally on these occasions under a haystack, and, as in another great house of congress, their deliberations are in the night. Their *discourse* is as loud as it is vehement. What they debate about is not exactly ascertained, but, no doubt, of matters of grave import to feline polity : war and commerce, ways and means, the falling of followers, the increase of rats, the shortening of tails, much arguing at anyrate about raising the wind ; for Erris cats are known to have the power of creating a storm or causing a calm ; and this supposition seems to have arisen from cats being observed scratching the leg of a stool or a table or any upright thing within their reach, previous to a gale of wind, looking most knowingly and consciously the whole time, and frequently accompanying their exercise with most melancholy mewings. The storm which succeeds is supposed to be the effect of this feline proceeding, which is looked on as an incantation, inasmuch that, the moment a cat is observed to commence this scratching, it is immediately struck at with a stick or tongs or any other weapon within reach ; it is, moreover, assaulted with a clap of curses peculiarly appropriate to cats under these circumstances. As soon as the storm begins to rise, all the available cats are seized and placed under metal pots, and there held in durance vile until they resort to the exercise of their power in causing a calm. Now, not only is this power universally allowed, but what is of incalculable importance, it is often taken advantage of by the cat's owner.'

Not very long ago, a vessel was detained in Blacksod Bay. During the time of delay, the skipper became intimate with and engaged the affections of Catty Kane. But when his vessel was ready for sea, the roving blade, with all a sailor's inconstancy, hoisted his sails and put out to sea, never intending to see the fair one more.

But Catty knew a trick worth two of that, and had recourse to her cat. And now the brig is put into all her trim to clear the bay, but in vain ; the wind blows a hurricane, and she must come back to her old anchorage. From this time forth, day after day, the captain used all possible skill to get out of the harbour ; but as often as he weighs anchor he is driven back again ; and Catty understands the management of her cat so well, that the brig must come in for shelter close to the poor girl's residence. This continued for many months. The cargo is spoiling ; what is he to do ? Why, as the captain finds it impossible to quit Catty, he must needs marry her ; and so, taking her and her cat on board and doing all decently, next day, with a fair wind and flowing sheet, he can and does bid adieu to Blacksod Bay. What a pity it is that spinsters in other portions of the Queen's dominions have not the art of Catty Kane in managing her grimalkin !

EXPIATION.

A STORY OF THE CHILIAN REVOLT.

CHAPTER II.

WEEKS, months, passed. The civil war continued with varying fortune. One day the Congress party gained some advantage, on another the President's troops were reported to have gained a brilliant victory. Not that there was any reliable news published : a strict censorship had been established, with the result that a drawn battle became a decisive victory, and a severe defeat a temporary check. Not everybody was misled by this device. The actual fortunes of the conflict were known to many, and an impression was gaining ground daily amongst those better informed that the repeated successes of the Congressionists pointed to a speedy termination of the war in their favour. The behaviour of Balmaceda himself lent much support to this belief. His authority was still paramount in the chief cities ; and, in showing increased severity towards his prisoners and terrorising every one of whom he had the least suspicion, he displayed the tyrant's premonition of impending disaster. It was almost possible to tell how the war progressed by observing his conduct towards his prisoners. Executions were becoming terribly common. The formality of trial was scarcely observed, in many cases entirely dispensed with. Ada and her mother had a terribly trying time. Suffering the cruellest tortures of suspense and anxiety on her husband's behalf, the young girl had to restrain and subdue every manifestation of it, to refrain from all inquiry, lest suspicion should light on them and worse happen. She had not seen her husband since that one meeting in the prison. Amongst the first of the President's orders after the outbreak of war was that prohibiting all intercourse between prisoners and their friends.

One day, a few months after George's incarceration, rumours of an affair between the two armies

reached the town. The Government industriously circulated the report that the rebels had made an unsuccessful attack; but, in spite of everything, it leaked out that, on the contrary, the President's troops had sustained a serious reverse. There was much secret rejoicing among the partisans of the Congress party, mingled with apprehensions as to what Balmaceda would do in the way of reprisal, apprehensions which gathered terror when it was seen next day that, for the first time, the defeat of the Government was *openly* asserted. It was said that Balmaceda was more enraged at this display of temerity and confidence than at the defeat itself.

The populace was tremendously excited. What business was done was transacted in feverish haste. Towards evening, rumours of severe measures of reprisal began to circulate, and the rejoicing of the Congressionists gave way to the most gloomy apprehensions as to the fate of their imprisoned comrades.

At an early hour on the following morning Don Pulido arrived at Mrs Gorman's house and asked for an immediate interview. Ada came down with her mother, and both were trembling with excitement, knowing that nothing but news of importance would have caused so early a visit. When Ada saw the lawyer's face and read the look of pity in it, her heart seemed to stop. She gasped and sobbed out: 'O God! what is it?' Then turning to the elder lady, just said: 'Oh dear mother!' and fell into her arms.

The terror and trouble of the last few months had left their marks on the young wife. A deep line between the eyes testified to the continual pressure of despairing thought, and the pallid cheeks and swollen eyes bore witness to many a sleepless, tearful night.

'I must speak to you alone,' said Don Pulido, addressing Mrs Gorman.

'No, no!' cried Ada. 'Let me know now, at once. Oh! he is dead! he is dead!'

'Not at all.'

The words were reassuring, but the tone and inflection were anything but cheering.

'He is not dead,' resumed the lawyer, 'and you may see him soon.'

'Free?'

'No!—Now, let me speak to your mother.'

'Why not tell me? What is it? Who has a better right than I to hear? Is it about George?'

'Yes; but I can only tell your mother. You will know all very soon. Please'—

Ada went away reluctantly.

'You have bad news, I see,' said the widow as the door closed.

'I have—terrible news. Before coming here, I have taken every pains to verify it, and'—

'Don't keep us in suspense. What is it?'

'George is condemned to death!'

'To death! For what?'

'Ask the brutal tyrant,' began the lawyer, but checked himself and paused.

Mrs Gorman was dumb.

'Balmaceda chooses to assert that his late defeat is due to the plots and machinations between the enemy and some of the suspected prisoners. Seven of them are on this ground to be shot to-day. I have seen the list.'

'How could they do any harm in prison?'

'There is no reason in it. It is a transparent

device. A stroke of revenge and an attempt to strike terror.'

'Oh my poor child! Is there no hope?'

'I fear not, unless our—the Congress troops reach here and capture the prison before nine o'clock this morning, and that'—

'Is impossible. My poor child!'

'If you think it advisable, I think I could gain permission for a last interview; but the time is short, very short.'

'I will tell Ada, and be guided by her bearing. God help me to support her. My dear, dear child! Poor George!—Will you wait a few minutes, my friend?'

'Of course! But lose no time, if you decide to see him again.'

The widow left the room. She was absent about ten minutes, and returned, accompanied by her daughter.

The lawyer looked closely to see what effect the fatal intelligence had had on the girl, but she was already dressed for going out, and the upper part of her face was hidden by a veil, and only the drooping, quivering lips were to be seen, visibly telling the agony of the sorely stricken heart.

'Shall we go?' whispered the old lady.

'Yes,' assented the lawyer. He bent an inquiring look on the mother, indicating Ada with a motion of his head which meant, 'Does she know all?'

Mrs Gorman nodded assent.

Outside the door, a conveyance was waiting, into which the three mounted, and were driven off. Early as it was, the town was astir. Little knots of men were conversing eagerly at street corners and crossings; women and children looked out from every door and window. Whilst driving through one of the main streets, a man on the side-walk signalled to the driver to stop, and, coming up to the carriage, entered into an earnest whispered conversation with Don Pulido, at the end of which he made off hurriedly, after saluting the ladies sympathetically.

The lawyer said nothing, but his face brightened and he looked somewhat less despondent. After leaving the town they saw several carriages driving quickly in the same direction, and a thin stream of people on foot making towards the prison. Don Pulido looked out eagerly and anxiously from side to side as they drove on. Ada was sitting quietly, looking out with that fixed unseeing gaze that tells of thoughts too intense for speech. Her face wore a terrible expression of repressed grief. Don Pulido looked at her, and her agony seemed to move him strongly. He leaned forward and whispered: 'There is to be an attempt at rescue. There is every hope—successfully!—Hush! not a word.'

Mrs Gorman was palpably cheered; but Ada had not heard, or, hearing, had not understood. She looked straight ahead, now with an eager, penetrating glance, as though she would overcome distance and all obstacles and see her lover-husband.

At last they came in sight of the prison, a low building surrounded by a high wall, the roof alone being visible from the outside. A number of people were present in scattered groups, kept, however, at a respectful distance from the prison walls by a cordon of soldiers. The carriage drove up until its progress was arrested by an officer.

'You cannot advance,' said he.

'I must see the Chief,' said the lawyer; 'these ladies are relatives of one of the condemned, and'—

'Hush!' said the officer, solemnly.

There came a peculiar clicking sound from within the walls. Then a sharp voice rang out! One word! A roll of musketry! A little cloud of smoke!

The officer turned. 'You were too late. It is over.' He pointed to Ada, who had fainted.

'What is the meaning of it?' excitedly queried the lawyer. 'It was fixed for nine o'clock.'

The man smiled. 'There were rumours of a rescue. To defeat it, the execution was put forward an hour.'

From the hour when this atrocious deed was perpetrated, the tide appeared to set stronger than ever against Balmaceda. Condemned by public opinion, deserted by many of his best supporters, harassed by an open enemy who outmanoeuvred and outfought his troops, he hastened to his end. Shortly after the execution, Mrs Gorman and Ada removed to Valparaiso, intending to sail thence to England. Associations were too painful to permit of their remaining in the country. It was, however, not found an easy matter to settle their business affairs in the unsettled state of the country, and they were compelled to linger on during all the later stages of the rebellion. The repeated successes of the insurgents had incited the President to such a degree of tyranny and severity that, outside his armed followers, he had few or no adherents. The great bulk of the populace were wishing and praying for his downfall.

In the beginning of August it was reported that a number of the Santiago prisoners had made their escape and fled, hotly chased to the mountains. Whether they evaded their pursuers or were overtaken and massacred was not known. They were not brought back.

At last the crisis was reached. The Congress troops effected a landing on the coast, and marched on Valparaiso. The President's army went out to meet them, and a week of desultory skirmishing took place, culminating in a great battle. In the result, Balmaceda's army was practically destroyed, and he himself became a fugitive. The victorious troops entered Valparaiso amid the acclamations and rejoicings of the inhabitants. A number of vessels which had been hovering about the port, awaiting the result of the fighting, now came boldly in and discharged a crowd of exiled and proscribed citizens. On the day following the entry of the victors, Ada and her mother ventured out into the streets. The town was in a state of disorder and tumult, as was to be expected, but the work of restoring order had begun. The two ladies stopped to read a proclamation on a wall, and while doing so, a well-known voice behind them exclaimed in a joyful tone: 'Ada! You here!'

Turning round quickly, they saw—George de Nardez. The two thus accosted, apparently by one from the grave, turned pale, trembled, and looked questioningly from one to the other.

'What does this mean?' said George. 'Do you not know me?'

Ada was the first to recover. She reached out her hand with a piteous gesture, half incredulous half rapturous, and said: 'George, my dear George! are you alive?'

The young man convinced her of his vitality by an ardent embrace. Then they turned homewards, George refusing to give or hear any explanations until they were safe indoors. Here they related their story—of the lawyer's visit, and his communication of the death sentence, of their drive to the prison only to reach it in time to hear the rattle of the musketry, carrying, as they thought, death to him and desolation to themselves.

'Don Pulido was mistaken, I suppose, George?' said Ada in conclusion; 'you were not among the condemned.'

'Most assuredly I was,' replied George.—'Let me tell you all. I had several interviews with my father whilst we were confined. He showed the deepest sorrow and remorse for his action towards me, and I believe, was unceasing in his efforts to obtain my release; but he had lost all his influence. One morning we were all called into the corridor. Father was amongst us, and managed to whisper to me that my name would be called, amongst a number of others, for transference to another prison, that he would answer to it, and take my place, as he had great hope by so doing of obtaining an audience with the President. Of course I assented, knowing he had sources of information not common to all the prisoners. Well, the names were called out, mine amongst them. Father stepped forward and took my place. As he passed me he slipped a letter into my hand. The remainder of us were reconducted to our cells. Soon after I heard the sound of firing, but I had no idea what it meant.' George paused—he was deeply affected.

The two listeners were in tears: they had guessed the rest.

'Oh dear! and I have been abusing him so bitterly,' said Ada.

'I looked at the letter,' continued George, 'and found it marked, "To be opened when you are freed. If that should not take place before six months elapse, or in the event of anything happening to you, to be sent to your wife." I put it carefully away. Weeks and weeks passed, and I had almost given up all hope of seeing your dear face again, my darling. By-and-by the surveillance of our jailers relaxed. I believe they were being drawn upon to join the army. We managed to establish communication with each other, and then with some friends outside. A plan of escape was formed, which succeeded. Eight of us got away, and reached the mountains. We had a hard bitter time of it—cold and hunger, weariness and despair, were always with us; but at last we reached the coast, and found a steamer, which brought us here just in time to hear of the tyrant's defeat.'

'And the letter, George?'

'Here it is!'

MY DEAR SON—You are condemned to be shot this morning. I, by whose folly this has been brought about, will take your place and your bullet. You may still have to suffer, but at least you have another chance. I have done

everything on earth to save you. I will die for you now, in the hope of sparing you to your wife, and earning her forgiveness and yours.

ENRIQUE DE NARDEZ.

THE CHIONODOXA LUCILLÆ, OR GLORY OF THE SNOW.

HAVING had the honour of introducing the Shirley Poppy and the poetical Edelweiss to the readers of *Chambers's Journal*, and both plants having become so popular and widely cultivated, it is hoped our enterprising readers will give their next attention to one of the loveliest of floral beauties, by way of experiment in floriculture, and select the *Chionodoxa* for that purpose. Its Greek name simply means 'the glory of the snow,' and is very aptly applied to a plant that grows aloof from human habitation, thousands of feet high, amongst the wildernesses of snow that envelop the mountainous ranges of Siberia and other high alpine altitudes. There it displays itself in its native home—its sweetness lost upon the desert air—unless a few ardent botanists cull its blooms for their own special purposes. As a botanical rarity, it has very much the appearance of a *Scilla* or blue squill, and at first sight greatly resembles the more familiar *Scilla Siberica*. Closer examination, however, proves it to be scarcely a squill at all, but a new candidate for fame, with the distinguishing generic title of *Chionodoxa*. The old proverb, 'Far-fetched, dear bought,' does not apply to this new favourite, which has been in cultivation in England several years now, although it has not made the headway we hope it will do when its beautiful flowers become known and its several advantages are made prominent. The Glory of the Snow grows taller than the Siberian squill. It is larger, of a sky-blue, cobalt, or porcelain colour, and is one of our most showy and splendid early-blooming bulbous plants, the petals arranging themselves almost like a blue star, with a white centre, formed by the claws of said petals at their insertion into the calyx. Readers will be glad to know that this exquisite flower is to be grown from the bulbs supplied by nurserymen in the autumn, and they may be treated like any others and with equal success. Take them any time now, and up to November, plant them wherever you choose, and they are sure to prosper. Give them any waste place on rock-work or in the garden, and they will cover it with beauty. Plant them in pots for the conservatory, and they will do equally well, and surprise those who have not already seen them with their simple, modest charms. They may be left undisturbed for years, requiring no thought and no fresh manipulation of soil; and every year, in the winter or early spring, they will unfold themselves and attract attention—'the cynosure of neighbouring eyes.'

This pretty plant completes our tricolour—red, white, and blue, a trio of lovely colours—the bridal Edelweiss, the brilliant rosy Shirley Poppy, and the cerulean Snow-glory. There is this to be said of the last, that it compares favourably with other vegetable blues, and may be used in many ways that will suggest themselves for ornamental work. The flowers may be put under

pressure between sheets of botanical paper, with the best results, not changing colour as much as other blue flowers are known to do. Deft fingers will improvise the most fascinating Christmas novelties from the dried specimens with the aid of a few blank cards; and they may be made to form delightful souvenirs for birthdays, Easter and New-year welcomes, and for sending round the world, wherever love and affection call for remembrance. Designs for brackets and fret-work, for windows, for panel-work and picture-frames, for bazaars ornamentation generally, and much other graceful and artistic elaboration, will be the fruitful result of a heap of these Snow-glory leaves and blossoms; and they will afford innocent and pleasant diversion for the young folk during the irksome winter evenings.

JOHN EMMET, F.L.S.

THE SWALLOW'S DEPARTURE.

'Yes, friend Blackbird, you say truly, all the summer flowers are dying,
And the harvest sheaves are garnered, and the air grows damp and cold,
And your kin have ceased their love-songs, and the mournful wind is sighing
In the woods through boughs of russet and of scarlet, bronze, and gold.

'But 'tis not because the cushats cry in chorus melancholy
That I'll seek the south and summer, not because the skies are gray,
Not because the wintry berries gleam upon the shining holly,
But because I'll bring good tidings to a soldier far away.

'Oft you've lurked amid the fruit-trees in the dear old-fashioned garden:
So you know the dwelling, Blackbird, that we built,
I and my mate,
Near the gnarled, ancient pear-tree, standing like a sturdy warden
O'er the bush of sweet musk roses by the narrow, rustic gate.

'There one eve I heard a soldier tell a maid he loved her dearly;
And she only laughed and answered all his words in mocking tone;
But since he has sailed to India, I've heard her oft and clearly
Say, while tear-drops dimmed her bright eyes, that her heart was all his own.

'So, 'tis not in dread of winter that my leave to-day I'm taking
Of you, Blackbird, till the spring-time brings new robes for wood and dell;
But because in tropic splendours that poor fellow's heart is aching,
And I must fly south to tell him that the maiden loves him well.'

THE STORY OF AN OLD SONG:

HEY, TUTTI, TAITIE.

IN an interleaved copy of Johnson's *Scots Musical Museum* there is a note on the fragments of an old song, in the handwriting of Burns, in which the following passage occurs: 'Many of our Scots airs have outlived their original, and perhaps many subsequent sets of verses.' It would be difficult to discover any better illustration of this remark than the air to which the poet wrote the memorable words of 'Scots, wha hae.'

In that bipartite work of art we call a song, the music seems to represent the soul, and the words the body; and when the soul wears the body out, as the sword does the scabbard, and the muddy vesture of decay begins to fall away from the spirit by which it lived, the soul itself, by some hidden power of musical metempsychosis, finds a fresh embodiment, reclothes herself, so to speak, in vernal singing robes, which will serve her for another term of her existence. The air to which 'Scots, wha hae' was written has worn out many sets of such singing garments, for it is one of the very oldest of Scottish songs. It has been known by many names, and in one disguise or another can be traced back at least four hundred years.

The words of its earliest known appearance as a song, 'Hey! Now the Day Dawis,' are not probably the first verses to which the tune was attached. Although the date of the birth of Alexander Montgomerie, the author of the words, is not known, he must have been writing previous to 1568, the date of the Bannatyne Manuscript, as some of his poetry occurs in that collection. But the song by that name was known long before his time. It is mentioned by Gavin Douglas (1512), Bishop of Dunkeld, in the prologue to the thirteenth book of his translation of Virgil, as a favourite song among the vulgar; while his still elder contemporary, Dunbar, alludes to it in one of his poems, in which he laughs at certain minstrels of Edinburgh for having only two tunes—

Your commone menstralis has no tune
But 'Now the Day Dawis,' and 'Into June.'

Montgomerie's verses, judging from their style, were probably not written before the reign of James VI., at whose court the poet was a retainer and pensioner, and were no doubt a revised version very considerably altered, while retaining the name of the much earlier song alluded to by Douglas and Dunbar, and by whose testimony we are enabled to establish the date of the air at not later than the beginning of the reign of James IV., however earlier it may have been composed. From the fact of its first appearance occurring in a Lute-book, the probability is that in the first place it was composed for that instrument either by a Scotchman who had received his musical education abroad, as was the fashion of the time, or by one of the Italian or French musicians at the court of the music-loving monarch, and among whom the king himself was an accomplished lute-player. Farther back, however, than the Douglas and Dunbar references carry us, all is conjecture; and the tradition alluded to by Burns that it was the air to which Bruce's army marched to the victory of Bannockburn is tradition and nothing more.

How the air acquired its later name of 'Hey, tutti, taitie,' or what that title means, has never been satisfactorily explained. Jamieson gives it as an interjection, meaning 'Pshaw!' but without stating his authority. He quotes a verse of a song in which the words occur, but where the substitution of the word 'Pshaw!' would make the verse absolutely ridiculous. He also conjectures it may mean 'the tuttling of a horn,' which does not help us much. Dr Douglas of Gala-shiels, he informs us, thought the phrase derived from a drinking song with a French refrain, 'Hei, toutes têtes, Ho, toutes têtes;' but, unfortunately, it is quite impossible to fit the Doctor's verse to the tune. It is more probably derived from the Italian musical phraseology, 'tutta' and 'tutto,' or their plurals, 'tutte' and 'tutti'—technical terms, indicating how the tune should be played, frequently seen on music, as well as

with their additions of 'tutta forza' (loud as possible), 'tutti unisoni,' &c. Such phrases—usually written at the top of the page—might easily be mistaken for the title to a piece of music, written for a lute, or an orchestra of such instruments as were used at that time, without any song-name attached to it. The addition of a final 'e' to the word 'tutti' gives it a Scotch character, while we have only to prefix the interjection 'Hey!' to make the metamorphosis from Italian to Scotch complete. Our simple exclamatory 'Hey!' has a very wide scope in Scottish poetry. In many of our songs it is used to heighten the general effect, as naturally as the crack of the finger and thumb in the Reel of Tulloch. Like all true idioms, it takes the colour of its context, hence the variety of its uses. To those unfortunate persons who have been born furth of the realm of Scotland, the effect of

Hey, the bonnie, how, the bonnie,
Hey, the bonnie briest-knots,

is simply incommunicable. In another direction it exhibits its sly, quizzical, side-glancing quality—

Hey, how, Johnnie my lad,
Ye're no sae kind's ye should hae been,

addressed to 'a cauldrie wooer;' which, again, is very different from the rousing effect in the satirical song of

Hey! Johnnie Cope, are ye wauken yet?

And once more, see how it lends itself to the dare-devil abandonment of the old song in Herd's Collection :

Sing Hey! play up the rinawa' bride,
For she has taen the gee.

Certainly, wherever the 'tutti, taitie' came from, the 'Hey' was not far to seek.

Montgomerie's song was long supposed to be lost, until Sibbald, as he tells us himself in his *Chronicles of Scottish Poetry*, was lucky enough to find it in a manuscript collection of poems in the College Library of Edinburgh. The music which Sibbald gives to the old song, although a little less ornate, is fundamentally the same air as that now in use.

A hundred years after Montgomerie's time, the tune reappears in a new dress, this time in a Jacobite costume, in the toast-song of 'Here's to the King, Sir,' published in Thomson's *Scottish Airs*, and containing an allusion to the project of Charles XII. of Sweden coming to the help of the House of Stuart, which enables us to fix its date about 1718. So all the sets of words, from first to last, can be sung to the same tune, by whatever name we choose to call it. Montgomerie's 'Hey! Now the Day Dawis,' of the end of the sixteenth century; the Jacobite drinking song of the beginning of last century; as well as the 'Scots, wha hae' of Burns, and Lady Nairne's 'Land o' the Leal'—both now about a hundred years old—are all fitted to the same frame, both musically and metrically. The poems in each case are written in the same stanza, that known as the Kyrielle, consisting of four lines,

the first, second, and third rhyming, while the fourth is used as a refrain. Perhaps the best-known and the most beautiful example of the Kyrielle in the language is Dean Milman's hymn, beginning, 'When our heads are bowed with woe.'

There has been some difference of opinion as to the exact date and circumstances under which Burns produced 'Scots, wha hae,' arising out of a discrepancy between a statement made by Burns in a letter to his friend Thomson, and a statement of quite a different kind made by his more intimate friend, John Syme. Mr Syme declares that the poem was composed when they were riding together through a thunder-storm between Kenmare and Gatehouse, in July 1793, and that on the following day Burns gave him a copy of the poem. But the poet, writing to Thomson a full month after, says that he wrote it 'yesternight.' The fact that the two friends did make the journey, as well as the time and place of it, is not disputed; and in believing that Burns was inaccurate, we are only believing in inaccuracies he was continually committing, many of them far more ridiculous than this. In one case he sent his friend Thomson a song which he declared he had just finished—'glowing from the mint' were the words he used—while he had sent the same poem two years before in a letter to Clarinda. There was no intention to misrepresent matters; but Burns was careless and forgetful about such things, and his pockets as well as his brains were kept crammed with song material by his indefatigable provider, Mr Thomson, so that he must have had many poems about him in every stage of development. Lockhart says we have the germ of Burns's ode in the rapture he expressed while standing on the field of Bannockburn, an eloquent note upon which appears in his *Journal* of August 1787, six years before the poem made its appearance. The poet, we must remember, had a reputation for improvising, which he was vain enough to encourage, although he lets us know what care he bestowed on his higher efforts; how, when all his preliminary cogitation and workings of his bosom were over, he retired with his subject 'to the solitary fireside of his study.' Who now would compare any of his admitted impromptus with his finished work? Had the poet lived to superintend a final edition of his works, he would not have suffered them to appear in the same volume with the 'Cotter's Saturday Night,' 'Halloween,' or 'Tam o' Shanter.' Poems like 'Scots, wha hae' are not written off the reel; and when Burns sent it to his friend Thomson, he probably did not intend to convey anything more than that he had given the final revision, the last touch to a poem he had been working on for some time, and of which—as we have seen—a prose version had been standing ready for use in his *Journal* for six years. The poet gains nothing from those worshippers of his who, with more zeal than discretion, credit him, in addition to his wonderful gifts, with the power of working miracles.

The tradition that 'Tam o' Shanter' was the unpremeditated outcome of a river-side ramble in the autumn of 1790 is another example of those ridiculous exaggerations, which can be abundantly refuted from the poet's own letters. The story is mainly supported by 'the not

immaculate M'Diarmid,' as Lockhart calls him, who, on purpose to make the performance more wonderful still, says that the poet wrote the verses 'on the top of a sod-dike.' There is a certain latitude allowed in telling a tale, but a certain limitation too. Sir Walter Scott said he never heard a story upon which he could not put what he called 'a cockit hat,' and the ornamentation is quite allowable, especially in the hands of a master. But we must surely draw the line at the ingenuity which, not content with supplying the 'cockit hat,' provides also the story upon which to put it. In a letter to Alexander Cunningham, dated 22d January 1791 (and this furnishes an exact parallel to the 'Scots, wha hae' letter to Thomson), Burns says: 'I have just finished a poem, which you will receive enclosed.' The poem was 'Tam o' Shanter,' and the letter scatters to the winds M'Diarmid and the sod-dike tradition. Burns knew well the pains the poem had cost him. In a letter to Mrs Dunlop he says 'that "Tam o' Shanter" shows a *finishing polish* that I despair of ever excelling.' When Ben Jonson said that a good poet is made as well as born, he might have said the same thing of a good poem—that, at all events, was Burns's opinion. Writing to Lady Don, we find him saying: 'Though the rough material of fine writing is undoubtedly the gift of genius, the workmanship is as certainly the united effort of labour, attention, and pains.' In fact, there is no short cut, no royal road between the inception and the completion of any subject upon which art is exercised. That Pallas sprung from the brain of Jupiter ready armed and complete at every point was all very well amongst the gods; but the myth has no counterpart in humanity. Burns's traditionary feat on the banks of the Nith was impossible not only for him but for any poet that ever lived. Neither Dante by the Arno nor Shakespeare by the Avon could have gone out for a river-stroll and brought back in his pocket such a piece of finished art as 'Tam o' Shanter'—one of the masterpieces of the world—not less remarkable for its marvellous construction than for its unrivalled imagery. It has the humour of Falstaff and the weird horror of the *Inferno*.

And so 'Scots, wha hae,' like 'Tam o' Shanter,' and indeed all Burns's best work, can easily be distinguished by the careful perfection of their finish from those other efforts of his which he did not think were worth the same labour. Only in his case, as in others, where the highest art comes into play, the products which appear to be the most natural and easy and artless are just those upon which the greatest art has been bestowed. No doubt, then, the story of John Syme is a true one, and that when he rode through the thunder-storm with his singing and gesticulating companion, he heard the first rough murmur of that great hymn which has since become the 'Marseillaise' of Scotland. The story at all events has been accepted by one of his best biographers, Lockhart, and by his still more distinguished critic, Carlyle, and there it may be safely allowed to rest.

In the history of a tune we occasionally encounter some curious and unsuspected transformations. The air usually sung to the Hundredth Psalm, and which has been by some erroneously

ascribed to Luther, was a love ditty long before his day. Henry II.'s queen used to sing to him her favourite psalm, 'Rebuke me not in thine indignation,' to a fashionable jig. Our air of 'Tutti, taitie' shows the same curious variety of uses. From a quaint old pastoral it passes into a boisterous drinking song. Then, from a fierce and defiant battle-cry, it seeks rest, as if with wearied wing, in the tender pathos of 'The Land o' the Leal.' Verily, on the world's stage, a tune, like a man, in its time plays many parts.

J. B. S.

BLOOD ROYAL.*

CHAPTER XL.—A TRAGEDY OR A COMEDY?

WHAT happened that night in Faussett's rooms Dick never knew. He would have given worlds, indeed, to have been able to remain in college for the evening; but, as ill-luck would have it he had an appointment at eight, which he was obliged to keep, with a tutor in Oriel. 'Twas with a very heavy heart, indeed, that he went to fulfil it. He hoped to be back by nine at latest; but the tutor, having nothing else to do, kept him engaged over his piece of Latin prose till not far from eleven. Oh, how impossible Dick found it to concentrate his mind under those painful circumstances on the oblique oration and the exact use of *ut* with the indicative, while he wondered all the time in his own soul what manner of things might be happening meanwhile at Faussett's rooms in Durham! The tutor had never known his pupil so stupid before; and the more Dick blundered the longer he kept him. Once or twice, to be sure, Dick tried hard to get away by a desperate hint; but the harder he tried, the more determinedly did the tutor resolve to detain him. It was unendurable that a young man should be so anxious to get away—no doubt with the object of going to some silly wine-party—that he couldn't concentrate his mind for a single moment on what his teachers told him!

At last the piece of Latin prose was finished, and Dick felt free to return to Durham. He rushed back, all on fire, and made his way at once towards Faussett's windows. He would listen beneath them and watch if he could hear his father's voice among the hubbub. There was laughing, and talking, and rattling of glasses. As he paused, sick at heart, his own college tutor passed by, and recognised him with a nod. 'Oh, by the way, Plantagenet,' he said carelessly, 'could you come up with me now to my rooms for a minute? I want to have a talk with you about that essay of yours yesterday.'

Dick's heart gave a bound of unspeakable terror; for just at that moment he heard his father's voice, singing, in Faussett's rooms. 'I beg your pardon, sir,' he said timidly, and with a terrible effort, for he felt he must do it;

* Copyright 1892 in the United States of America by the Cassell Publishing Company.

'wouldn't any other time suit you? I—I was very anxious to go up to Faussett's rooms this evening.'

As he spoke, a peal of laughter resounded from the windows above. 'Jolly good song!—Now, Gillingham! A recitation!' Dick listened with horror. But the tutor looked up and smiled a coldly disapproving smile. 'I don't think you'll miss much,' he said, in a chilly voice, 'by not going up there this evening. Faussett's a noisy fellow. He has too many supper parties. Better come to my rooms now, and leave him to his orgies.'

What could poor Dick do? Very shame prevented him from telling his tutor why he wanted to go up to Faussett's wine-party that night; so, with a sheepish air externally and a burning heart within, he followed his superior up to those panelled rooms which would have excited Clarence's warmest admiration. For many minutes he sat there, by the open window, hearing vague sounds now and again that floated across intermittently from the opposite quad, and totally unable to bring his mind to bear on what his tutor was saying. At last, quite suddenly, the voices ceased: there came a lull in the noise. Dick, straining every nerve to hear, caught strange sounds that appealed to him far more than his tutor's voice. It was his father speaking! Unable to contain himself, he turned his head towards the window and listened attentively. To his surprise and alarm, he could hear Mr Plantagenet raising his voice, not in merriment now, but in indignant anger. What Faussett and his friends might have said or done to rouse the poor pitiful old man, Dick never knew. But fallen as he was, Edmund Plantagenet had in him still in some ways the feelings of a gentleman; and it was clear that something had happened to hurt and wound them. Dick looked out once more. Across the quad, as in a shadow, he could see his father rise in the room with an angry gesture. He rose so straight and erect that for a second Dick felt relieved: all was well in that way: at least he was sober! A few minutes before, to be sure, he had been staggering and unsteady; but whatever had happened to rouse him now had had the effect of immediately sobering him. He was white with anger. Straight as an arrow, he shook his long gray hair fiercely off his forehead, and glared with angry eyes at Trevor Gillingham. Dick felt so much by the mere outline of his figure in dark against the blinding lamplight. What he said, Dick couldn't hear; but the voice in which he said it was one of mingled contempt and bitter indignation. Dick was surprised to see so much fire in his father's eye; to hear so much manly indignation in his father's voice. Mr Plantagenet raised his hand for a moment full in front of the window; then he turned away angrily towards the door behind him. Gillingham, with a frightened air, tried to interpose himself in the way and stop him from departing. But Mr Plantagenet would not be stopped. He walked over to the door, upright, without flinching or staggering, and turned the handle without a second's hesitation. He looked as if he had never had a single glass of sherry. Dick could stand it no longer. 'I beg your pardon, sir,' he cried, turning to the

tutor in his dismay. 'I can't stop another minute! I must go! It's imperative! You mustn't try to keep me—I have a sufficient reason. I can't and won't stop one minute longer.'

The tutor had been sitting with his back to the window, and was far too much accustomed to noise in Faussett's rooms to attach any importance to that habitual interruption; but Dick spoke so seriously now that he couldn't pretend not to notice the genuineness of his feeling. He concluded Plantagenet must be ill all the time—which accounted for his dullness—and wondered he hadn't had the sense to say so earlier. 'Oh, certainly,' he answered, rising. 'You can go, if you like. I'm sorry I kept you. Come up again to-morrow and we'll talk this over.'

But as he said it, from Faussett's rooms there came a deadly hush, as all the noisy lads became aware of the gravity of the situation. Gillingham, thoroughly frightened at the turn things were taking, stood forward to stop the old man from leaving. 'I beg your pardon, Mr Plantagenet,' he said with a very red face. 'I'm sorry I've hurt your feelings. I'm sure I didn't mean it. I wanted rather to offer you a delicate compliment by that slight recitation from Barry Neville's works. I—I meant no imputation of any sort upon your present position.'

But Edmund Plantagenet was too wroth for words. Something had happened that stung the old man back into self-respect at once—a stray flash of self-respect that revealed to him, as it were, all his habitual degradation. He motioned aside the Born Poet with a stately wave of the hand. Then, with a profound bow, that had nothing of the dancing-master in it, but a great deal of the angry courtesy of fifty years since, he shut the door sternly in the young man's face, and turned to descend the winding stone staircase.

For a moment there was silent dismay in the room as Mr Plantagenet's footsteps died away through the quadrangle. Then Faussett spoke. 'I'm afraid we've done it now,' he said with a scared white face, turning round to the awed and speechless company. 'He seems very much roused. I hope he won't go and do himself any mischief.'

'I fancy not,' Trevor Gillingham answered, trying to seem unconcerned, for he had been in some ways the chief offender. 'By George, I wouldn't have believed the old man had so much dignity left in him. It was almost worth while doing it to see how he bridled up and became a man in a moment. There was a touch of King Lear in the grand way he blustered. I liked to see him do it; though it's only a dying flicker of what was once a gentleman. He could write well once, and I know by heart several other pieces of his.'

'I don't quite like it,' Faussett interposed. 'You carried the joke a little bit too far, you know, Gillingham; made him feel too acutely the great gulf fixed between his past and his present. I'm almost afraid he may do himself some injury.'

Gillingham shared that fear in his heart—which was an excellent reason for pretending to laugh at it. 'Oh, no danger,' he answered smiling. 'He's a bit excited now; but he's sobered for

the moment; that'll soon pass off again. By the time he's down the stairs, he'll forget all about it, and come up smiling to-morrow morning. He's too far gone for real remorse. This is a temporary outbreak of spleen and self-reproach; it never lives long in a temperament like his. He'll be laughing and talking in an hour, I'll bet you, at some bar in Oxford.'

Even as he spoke, the door opened, with a very slight knock, and all unannounced, Richard Plantagenet entered, pale and trembling.

'My father!' he cried, looking round the room anxiously with a restless glance. 'What have you done with my father? I heard his voice just now as I passed outside, and I've come up to look for him.' Then he turned to Gillingham with an accusing face. 'Where is he?' he asked once more, gazing round him in dismay, for a deadly silence reigned, and never in his life before had he heard such a ring in Edmund Plantagenet's voice as he had heard that evening. 'What have you been doing in these rooms to-night with him?'

Gillingham hesitated. Dick's pallor and earnestness produced a deep and instantaneous effect upon him. He was afraid to speak. But Faussett, as the founder of the feast, stood forward manfully. 'Mr Plantagenet has been spending the evening in my rooms as my guest,' he answered as politely and unconcernedly as possible. 'But he's just left now; I wonder you didn't meet him; I fancy he's gone home direct to his own lodgings.'

Dick drew back in horror, and glanced from one to another of the abashed conspirators in silent misery. They quailed before his eye, but none of them said anything. Dick didn't delay a moment. He knew from the sound of his father's voice something very unwonted and terrible had happened. Though he hadn't caught a single word of what was said in the room, he had seen the faces and heard the tones, and never before in his life had he known those lips speak out with such pathetic and offended dignity. He trembled for the result of so strange an adventure.

There was no time to be lost, however. The situation was critical. With a burning heart he rushed back to the porter's lodge. The big gate was shut and locked. He beat his fist against it helplessly. 'For Heaven's sake,' he cried with wild fervour, 'let me out, I implore you! Let me out, let me out, or I can't answer for the consequences!'

'Very sorry, sir,' the porter answered with official calmness, rattling the keys in his hand, 'but I can't possibly do it. The clock's gone eleven. Can't allow any gentleman out now without leave from the Dean, sir.'

'Then Heaven save him!' Dick cried, wringing his hands in terror; 'for if he goes out alone like that in such a state of mind, Heaven only knows what on earth may become of him!'

The porter was a man of the world, accustomed to the ways of the Oxford undergraduate, and he entered at once into the nature of the situation. 'Beg pardon, sir,' he answered cheerfully, touching his hat as he spoke. 'If you mean the elderly gentleman with the gray hair, from Mr Faussett's rooms, as has just gone out, he won't come to no harm. He seemed to me to walk

quite cool and collected-like. If you'll excuse my saying it, sir, he was perfectly sober.'

But Dick turned and rushed wildly in an agony of suspense to his own rooms in the Back Quad. There he spent a sleepless night in unspeakable misery. He would have given anything on earth if only he had dared to ask for leave to go out of college. But how ask for it even, without seeming to reflect on his own father's character?

(To be continued.)

TULLE AND ITS GOVERNMENT FACTORIES OF ARMS.

ACCORDING to an Italian folk-tale, a fairy god-mother asked a woman to whose child she had stood sponsor whether she should endow the boy with wealth or honours or promise him a beautiful wife. 'Give him Impudence,' answered the mother, 'and everything else will come into his hands—wealth, honours, and a beautiful woman.' The Sieur Martial Féris de Lacombe, Procureur du Roy, and President of Tulle in the seventeenth century, was certainly richly endowed with that most precious gift of impudence. He drove the inhabitants almost into riot by his exactions, but cowed them by his unblushing effrontery. He made his own fortune; but it must be allowed that he conferred on his native city a benefit that is bearing fruit to the present day.

Tulle in the middle ages had been noted for its arquebuse-makers; the place was well calculated by nature for the manufacturing of arms. It had iron mines in the mountains of Lower Limousin, vast forests of oak to supply charcoal, splendid nut-trees of which to fashion stocks, quarries of whetstone, and masses of clay for castings. The Sieur Féris had his armourer's shop and factory in 1698; then he married an heiress, the daughter of a paper-maker at Souillac, close to Tulle, and for a while he made paper as well as arms. But the Sieur had a soul that was not content with such a limited sphere of business, and as Procureur du Roy he thought he saw his way to doing something on a very large scale indeed. By some means—it is not certain how—he obtained Government orders for firearms for the fleet, and very speedily he obtained the monopoly of supplying the fleet with arms. The methods of manufacture hitherto adopted by the armourers of Tulle were not perfect, and the Sieur induced skilled workmen to come to him from Liège, so as to introduce all the improvements known to the Liégeois armourers. The Sieur now undertook voyages to all the Government colonies and stations. He was several times in the Mediterranean; he crossed the Atlantic to Canada, and contrived to supply the forts under the French everywhere with his weapons manufactured at Tulle.

The paper-mill at Souillac was now transformed. The water-wheel was retained; and the ponds of the little river Céronne were employed in the polishing of gun-barrels instead of the

conversion of rags into pulp. The business of the *Sieur Fénis de Lacombe* was now in full swing. He assumed for his factory the title of the 'Royal Manufactory of Arms,' without any patent to authorise him so to do, and he made his will felt in Tulle in a manner most insufferable to the inhabitants. Pretending that he was armed with royal authority to press men and beasts, and quarter workmen where he would, he seized on the horses and mules of the carriers and laded them with firearms, which he despatched to the arsenals. If he paid an indemnity, it was such a sum as he himself chose to fix. His men waylaid travellers, cut the girths and cords that bound their packages on the beasts of burden, left the travellers distracted with their goods on the high-road, and drove away their beasts to be laden with his stores. If they protested—'De part le Roy' was his answer. He cut down trees for gun-stocks and oak for charcoal where he would, in the parks of the gentry and the forests of the communes, and no redress was to be had. He acted 'de part le Roy.' He quartered his foreign workmen in the houses of the citizens without leave, and fixed the price at which they were to be entertained. No one had the courage to ask to see his patent authorising him to use such high-handed powers, and no one doubted that the title of 'Manufacture Royale d'Armes' given to his shops was justified.

Unable always to supply orders as rapidly as was required, he entered—so it is asserted—into secret negotiation with the Superintendent of the genuine Royal factory at Saint-Etienne, got a number of weapons there made at Government cost transferred to himself, put his own mark on them, and sold them to the Government as his own manufacture.

It is not at all surprising that by this means the *Sieur de Lacombe* realised a large fortune, and was able to buy up large encumbered estates in the neighbourhood of Tulle; and that his son, *Jean Martial de Fénis*, was able to contract a marriage with a lady of the old and proud noblesse of Normandy, *Charlotte de Charmois*, and to tack on to his name the title of *de Victour* from a seigneurial estate his father had bought.

Martial de Fénis de Lacombe died in 1729, and his factories passed to his widow and his brother *Gabriel*, provost of the Cathedral, till his son came of age to carry them on himself. *Jean* took to the making of cannon in 1770, and secured for his factory the royal patent; and a royal inspector, the Baron d'Escordal, was appointed to control the output. But the *Fénis* family were by no means the sole makers of arms in Tulle; a large clan of the name of *Pauphille* made guns for the chase at Tulle of two sizes—single-barrelled, which went in commerce by the name of 'grand Tulle' and 'petit Tulle.' These were largely exported to Canada, where many an old French Canadian family

still possesses them as relics of their forefathers.

To return to the factory that was now royal. With the Revolution it passed through a period of great fluctuation of prosperity. A law of 1792 placed all factories of arms under a Commission: in 1804 they were put into the hands of the Minister of War. In 1793 the *Comité de Salut Public* was empowered to cut trees in the woods of the emigrant landowners, to turn what buildings were desirable into arsenals, and to convert every father of a family into an armourer. The number of workmen rose in the factory at Tulle from two hundred and thirty-seven to six hundred and sixty-nine, and of these fourteen were women. In 1791-92 the factory at Souillac turned out 14,127 guns, on an average five hundred per month. At present, the factories have been reconstructed and greatly extended. There are two, one at Souillac, and another at Laguenne, two suburbs of Tulle; and there are workshops in the town for the making of stocks, &c. The number of workmen now engaged varies from 1500 to 3000. At Souillac the rifling and polishing of the guns take place. The buildings occupy the entire bed of the valley between mountains clothed in forest of pine, oak coppice, and chestnuts. The modest factory of the *Sieur* remains, or a portion of it, incorporated in the modern buildings.

Tulle itself is a singular old town; it lies in a tortuous glen, clustered about some rocks and hills, that start out of the valley bottom beside the river *Corrèze*. The highest of these hills, one fortified by nature, was the stronghold of the ancient Gaulish inhabitants. It is now the cemetery; but to the east may still be traced some of the ancient ramparts that have not been enclosed for the graveyard.

The Cathedral is of fine-grained granite, of the twelfth century, begun in bold style, carried up to a gallery below the clerestory, and then finished off in a feeble and inexpressive fashion. The church has a tower and spire at the west end, all of granite, and not remarkably good. The transepts and choir were pulled down at the Revolution, as they projected towards the river, and made the way contracted and inconvenient. A second church is that of St John the Baptist, of the thirteenth century, very badly treated externally. A curious twelfth-century octagonal church lies to the north of the town, and seems to have been originally a baptistery. Later, it became the church of the Carmelites. The days of costume for men and women are over; the old Limousin head-dress is no longer seen; but there is something picturesque in the long dark flowing cloaks of the women, with their hoods, very much resembling those worn by the Flemish women of Bruges and Antwerp.

What would have become of Tulle but for the *Sieur de Lacombe*? Without the national manufactories of arms, it would have nothing on which to live. Dead and sleepy and behind the rest of the world it is now. It would surely have dwindled to nothingness but for his high-handed conduct, his impudence, his energy, and assurance. And so it has come about that out of considerable wrong done in one quarter of a century, great good has sprung during two; and that Tulle will remain the great national factory of arms for

France for some time to come is certain, for no place is more central, less accessible to an invader, and more naturally protected against invasion by its granite mountain walls.

BABY JOHN.*

CHAPTER VII.—RETURN.

Come,
I'll fill your grave up; stir;
Nay, come away;
Bequeath to death your numbness,
For from death
Dear life redeems you.

SHAKESPEARE.

A FORTNIGHT later John Craddock got out of the train at Beston. He had come direct there on landing at Liverpool, without going to Felsby or communicating with any one there. If Lucy had been living, he would have done this, and there was a kind of dreary satisfaction in going direct to Lucy dead. He had the little box with the earrings in his breast pocket. He wondered so often if she would have liked them, or if they would have shared the fate of the other trinkets he had given her. He would have liked to slip them into her dead hand, for no one else should wear them, but he would be too late even for this, for the funeral would have been a week ago and more in the little churchyard at Beston. He remembered passing it that night when he looked through the window at Lucy and Baby John, the little rough church with a stumpy tower, and under its shadow a few clustered graves, some with rude headstones, but most with merely green mounds. He would rather think of her lying there than in the crowded cemetery outside Felsby, and he tried to picture the funeral where George Mills and Alice Reynolds would have been the only mourners, for his mother was too rheumatic to manage the journey; and he remembered sadly that she had never taken to Lucy, and that he had not gone the right way to work to make her do so. Perhaps Alice might have carried Baby John to his mother's funeral; he fancied she would have done so, she was so fond of Lucy, a very true friend, faithful to her through that separation he had insisted on, when she might well have thought that it was Lucy's own doing. He determined that Alice should never want a friend or a home; and if she would, as he had little doubt, consent to take care of Baby John, she should have it all as she liked best, for Lucy's sake.

It was a beautiful, bright September day as he travelled across England towards Beston; as bright as that day four months ago when he left the little place with that new, warm feeling for his wife and child that had grown and brought forth such bright flowers of hope and anticipation. The trees, which were then putting on their tender young foliage, were now showing signs of autumn's touch, golden and crimson and russet; and the cornfields, which had been displaying that rare vivid green in May, were bare stubble or ploughed land; and under the hedgerows and trees lay heaps of dead leaves.

John Craddock, as he gazed dully on the landscape from the railway carriage, felt as if those

dead leaves, those bare furrows, were like his life with its withered hopes, and the approaching winter of lonely old age.

It was evening when he reached Beston; but though it was lighted with not very brilliant oil-lamps instead of the lovely May sunshine, the little station brought back vividly his parting with his wife. Oh, if only he had known that it was the last time he should see her! Why did he not let the train go, and stop with her, turn back to the little lodgings, and take Baby John in his arms, and begin the new life from that day? What did the most important business in the world signify, compared with a life's happiness? Perhaps if he had been there he might have prevented the illness that had stricken her down in her health and strength. He felt as if, had he been there, nothing could have harmed her, that his love could have protected her from the arrow that flieth by night, or the sickness that destroyeth in the noonday.

'Where to, sir?' the porter asked, as he took John Craddock's portmanteau, the only luggage taken out of the train, Mr Craddock being the only passenger. 'The bus don't meet the trains, now the season's done and all the holiday folks left. But if you're going to the *Seaview* I'll just carry it round.'

Mr Craddock had not thought where he would go, having an indistinct feeling that he was going to that fire-lighted room where Lucy sat, and which meant home to him; but he let the porter take the portmanteau to the *Seaview*, and followed slowly the man's brisk footsteps. There was no gas in Beston; but it was not dark, for a great white moon was riding through the clouds, and drawing a broad silver line on the quiet sea, which sighed softly and sadly on the beach, drawing back with a hush lest it should wake the sleepers.

The church stands a little higher than the rest of the place, so that, from the churchyard, you see, over the terrace of houses in front, a wide stretch of sea. Mr Craddock took this way, though it was by no means the shortest to the *Seaview*, and the porter carrying the portmanteau glanced round over his shoulder, thinking he had mistaken his way, being a stranger to the place.

How quiet it was! The whole place might have been dead as well as Lucy for all the sound there was; only the 'Hush, hush' of the sea, which seemed to intensify the stillness. He found his way to the new-made grave; it was not turfed yet, but he could see in the clear moonlight that there were flowers on it, and he imagined how Alice brought Baby John there every day.

It seemed almost more impossible to believe that Lucy was dead, now that he was standing by her grave, than it had been when the telegram first came, or during the voyage home. The loss seemed more terrible, more unbearable, more unbelievable; his whole soul rose up in passionate, despairing protest as he stretched out his empty, yearning arms over his young wife's grave, crying to the God above that great, quiet vault of indigo sky, beyond that great dark stretch of sea with the long silver line of moonlight on it, 'Oh, give her back to me!' A passionate, self-willed, undisciplined prayer, without the resignation and submission to the Divine will that all

* Copyright 1892 in the United States of America by Roberts Brothers.

prayers should have; and yet, it may be, such prayers find their way to the throne of grace, and their unworthiness is forgiven for the sake of their heart-broken reality. But the great white moon above looked quietly down on his grief, and the waves on the beach only answered with their gentle 'Hush, hush.'

When John Craddock left the churchyard, he turned his steps almost involuntarily to Mrs Tripp's cottage. He did not mean to go in and see Alice and the baby to-night; to-morrow would be soon enough to hear all particulars and make any arrangements for the future; but he thought he would just walk past the house and recall once more the scene he had looked at four months ago. The moon was hidden behind a bank of clouds, and as he turned the corner he saw that now, as on that evening, light was streaming from the little window on to the small garden, where marigolds and asters had taken the place of wall-flower.

It gave him a pang, half pleasure, half pain, that this should be so, and as he came up to the house and laid his hand on the palings, he shut his eyes and conjured up every detail of that scene—the firelight shining on the white cloth, and the tea-things on the table pushed back out of the way; the pictures on the wall, the big shells on the mantel-piece, the baby's cradle by the fireside, and Lucy sitting in the low chair with the baby on her lap and Alice kneeling in front. How vividly he remembered it all! It cost him an effort to open his eyes to look on the changed reality.

And then his heart seemed to stop beating, and he clutched at the railings for support. Could vivid memory produce such strange hallucinations? Were his eyes playing him false? Was his head going wrong? For it seemed to him that he saw Lucy there sitting before the fire with Baby John on her lap—Lucy, who had been dead a fortnight, whose grave he had seen not ten minutes ago in the moonlight!

He tried to collect his thoughts, to pull himself together, to shake off this curious impression; he stamped his foot on the ground, he clenched his hands, he rubbed his eyes. And then he looked again through the little window, and again he seemed to see his wife with the child in her arms.

The child was sleeping, and she was leaning forward and looking into the fire with sad, wistful eyes, and thoughtfully turning the thick wedding-ring on her finger. As he watched her in stunned, incredulous silence, she got up and laid the sleeping child in the cradle; and the movement seemed to break the spell that kept him, and the next minute he was in the room, with Lucy in his arms, and warm, living arms round his neck.

'Dear heart! how he cried,' Lucy used to tell Baby John—for, now Alice was gone, there was no one to whom she could talk of her husband, though nowadays she could always talk to him. 'I'd never have dreamed that he'd have cared so much, and I'd never seen a man cry before, and it did make me feel funny, and yet I was that glad, Baby John, that I couldn't help crying too; so there were a pair of sillies of us. It was a good thing, Baby John, that you was asleep, or you'd never have honoured your father or mother

again in your life, and I'd thought I'd cried all my tears away for Alice. And he'd brought a workbox for her, such a beauty! she would have been that pleased! I can't help hoping as she knows about it with the sandal-wood as smells lovely, and the red silk inside. And she'd think such a lot of its coming from him. And them earrings too! they'd have been just the very ones she'd have chosen, if she and me had been standing outside Percy's window and choosing out which we'd have when our ships came in. Leastways, she'd have chosen them for me, for she always chose the prettiest as she'd like me to have, and then the next prettiest for herself; it was always that way, bless her! And so, Baby John, that's why I've got 'em on now, though I know as they don't go with crape, to please her—and to please him.'

It was Alice who was taken. She had been failing all through that bright summer, though Lucy, with all the blindness of love, could not see it. But at last the weakness and shortness of breath grew so painfully apparent, that a doctor was called in.

'Don't tell her,' Alice panted, reading her sentence on his kind, grave face. 'Don't tell her; maybe I'll live till her husband comes home. It won't be long now.'

Perhaps this was the least kind thing that Alice ever did in her life, for in her wish to spare Lucy the anxiety and dread, she prepared a crushing blow for her, that, when it fell, seemed to overwhelm her with its suddenness.

'I'm sure she's better,' she used to say.—'Don't you feel a bit stronger, Alice? You're not near so tired to-night.—She really seemed to relish that bit of chicken for her dinner.'

'It's only faintness!' she kept declaring to the very end, when the life was ebbing so gently away. 'She's asleep,' she whispered, with great, wide eyes of mixed entreaty and defiance at Mrs Tripp, as they laid the wasted form back on the pillows, with that look of ineffable peace on the face which there is no mistaking.

When she realised what had happened, she was prostrated; so entirely so, that kind, old Mrs Tripp took matters into her own hands and telegraphed to Felsby: 'The poor young lady died this morning. Come at once.' And George Mills, who knew nothing of Alice or of her illness, and only knew that Lucy was staying at Beston for her health, concluded that it was she who had died, and, before starting for Beston, sent the telegram to Mr Craddock. Of course, directly he reached Beston, he discovered the terrible mistake he had made, and did not lose a minute in despatching another telegram, which reached the hotel before Mr Craddock was out of sight of land, and this was followed by a letter containing all particulars; for, as I have said, his return to England was not expected for another two months.

But John Craddock thought that that fortnight's suffering was more than repaid by the clasp of his wife's living, yes, and loving arms round his neck. For Alice he always cherished a grateful and tender memory. 'She gave you back to me, my darling,' he used to say, 'three times. First when she came that evening when you lay dying. Yes, the doctor had just been breaking to me that I must be prepared for the

worst, but you came back for her. And then, do you know, I think she and Baby John together made you like me, gave me back a little of my wife's love, which seemed gone, even if I had ever had it. And third—I know it's my fancy, but I cannot get it out of my head, that you really died that day, only Alice took your place, and gave you back to me.

'She'd have done it and welcome, Alice would,' Lucy always answered.

THE END.

ST MICHAEL'S DAY AND BIRD.

THE festival of St Michael and all the Holy Angels is one of those days which both the Eastern and the Western branches of the Christian Church agree to observe as one of high holiday. Why the Archangel Michael should be selected thus to head the celestial hierarchy is obscure, for his theological attributes are not clearly defined; but it appears that the term 'saint' was first applied to him in the reign of Constantine the Great, who built a magnificent church at a short distance from Constantinople, and dedicated it to St Michael.

In the Roman calendar the rigid observance of the festival was first decreed, in the year 606, by Pope Boniface III., although the day appears to have been kept quite a century and a half earlier. In his exposition of the Book of Common Prayer, Wheatley says, referring to the subject: 'The feast of St Michael and all Angels is observed that men may know what benefits are derived from the ministry of angels.'

Michaelmas Day is known to most of us as one of the quarter days upon which rent is due, if not actually paid; and it has also been set apart from very early times, both in England and in other countries, as the day for the annual election of many civil and municipal officers; and the reason commonly given is that 'every man has his guardian angel, who attends him from the cradle to the grave, from the moment of his coming to the moment of his going out of life.'

The ecclesiastical origin of the day troubles the average Briton but little. If he observe the festival at all, it is rather as a matter of practice than of principle; and the custom which he regularly follows, with all a Briton's pertinacity, is that of eating his Michaelmas goose. Sundry and divers reasons have been assigned for the custom. The true one is probably the somewhat unromantic fact that the goose is in her prime at this season. She has gleaned amongst the harvest stubble for several weeks, and is fat and tender. There is a well-known tradition that Queen Elizabeth received the glad news of the defeat and destruction of the Invincible Armada while dining upon goose on the 29th of September 1588, and that, to commemorate the victory, Her Majesty was pleased to direct that, ever afterwards, a roasted goose should be served at her

table upon the anniversary of the day. The tale may be true; but history is made up of doubts, and, as the Armada was defeated in the last days of July and the beginning of August, it does seem strange—while making every allowance for defective postal communication, and for the difference between the old style and the new—that Good Queen Bess should have remained in ignorance of her great deliverance for so long a period. Unfortunately, too, for the legend, our feudal records contain references to the custom at a period long anterior to that of the Tudor sovereigns. Blount, in his *Ancient Tenures of Lands, and Customs of Manors*, gives one such instance. 'Among other services,' he says, 'John de la Hay was bound to render to William Barnaby, Lord of Lastres, in the county of Hereford, for a parcel of the demesne land, one goose fit for the lord's dinner on the feast of St Michael the Archangel, and this was as early as the tenth year of King Edward IV.'

Certain animals have characters ascribed to them, whether for good or for evil, which they very little deserve, and foremost among these unfortunate creatures stands the goose. Gross stupidity and overweening vanity are the qualities with which this much-decried biped is commonly credited. It is not a little remarkable, however, that the reputation of being the fool of the animal family has only been attached to the goose in comparatively modern times. Among the ancients, the goose was celebrated and even worshipped for her beauties and many prominent virtues. We have all read how the vigilant watch of the cackling sentinels once saved old Rome, and of the divine honours paid to the birds by the grateful citizens. Pliny praises the goose for her modesty, which, he states, is her most conspicuous characteristic; and, he remarks, 'one might almost be tempted to think that these creatures have an appreciation of wisdom, for it is said that one of them was the constant companion of the peripatetic philosopher Lycades, and would never leave him, either in public or when at the bath, by night or by day.' When this sagacious bird paid the debt of nature, her sorrowing master conferred upon her the highest honours in his power; her funeral was splendid and costly. Scaliger declares that the goose is the very emblem of careflessness. She physics herself as soon as she feels unwell, and never passes under an arch without bowing her head, thus preventing the possibility of an accident. Another writer, who evidently had no love for geese, thus expresses himself: 'She hath a great opinion of her own stature, especially if she be in the company of the rest of her neighbours and fellow-gossipes, the ducks and hennies, at a harvest feast; for then if she enter into the Hall there, as high and wide as the Doore is, she will stoop, for fear of breaking her head.' He continues: 'At a Wake, when they assemble themselves together at a town-greene, then they sing their Ballets, and lay out such throats as the country fiddlers cannot be heard.'

As an instance of the sagacity of the goose, one legend relates, that when a flock crosses Mount Taurus, where eagles abound, each individual

carries a stone in its beak, and so prevents its tongue from making its presence known to the enemy by any involuntary hissing, or thoughtless cackle to a fellow-traveller.

In former times, no higher compliment could be paid to a man than to compare him with this model bird. We read that St Quintin was so remarkable for his chastity, vigilance, and sobriety, that the Bishop of Vienne stated in his eulogy that the departed holy man was very similar to a goose.

It was long a belief that the physical, mental, and moral qualities of mankind were intimately connected with his food, and savage nations often eat the flesh and drink the blood of their slain enemies and of the fiercer beasts of prey, in order to obtain their strength and courage. The flesh of doves, hares, and deer was thought to cause gentleness, timidity, and equanimity of mind; while the Egyptians ate goose-flesh to stimulate the activity of their brains. An English poet writes, in reference to the goose :

Her brains, with salt and pepper if you blend
And eat, they will the understanding mend,
Her lungs and liver, into powder dried,
And, fasting, in an ass's milk applied,
Is an experienced cordial for the spleen.

A mediæval physician prescribed, as a remedy for convulsions, a compound of goose-grease, spice, and roasted cat, the latter animal being associated with the former probably on account of its proverbial air of composure and its placid demeanour.

In some parts of England, geese are still kept with the cattle, the association being considered most beneficial to the mothers of the herd. In other parts they are supposed to cure hydrophobia, and to protect packs of hounds against the spread of rabies. We thus see that the bird was formerly esteemed rather for its moral virtues and medicinal properties than for its real gastronomic excellences.

The goose is perhaps the only animal in whom disease is deliberately induced to increase its value as an edible commodity. The well-known *pâté de foie gras* of Strasburg is made from goose livers in a state of morbid development, caused by excessive over-feeding, and a forced and inactive exposure to artificial heat.

In France, the goose is eaten upon St Martin's Day, and a curious legend is related to account for the custom. Martin was a native of Hungary, and after a series of marvellous adventures, finally settled down as a hermit, and resided in a cave near Tours, of which place he became bishop. In addition to the raging of the heathen, he was greatly persecuted by a number of evil-minded geese, who annoyed him in every possible way; and at last an irreverent gander actually preached in opposition to the saint, who was vexed, as he said, to an extent to which a saint ought not to be vexed. Disgusted beyond all endurance, he retreated to his cave. To his consternation, he found that during his absence it had been occupied by a goose, who was now making energetic arrangements for rearing a young family. This was too much. The enraged celibate made a hearty dinner of the sacrilegious bird, and being accustomed to hermit's fare only, speedily died from indigestion.

On each succeeding anniversary of the day, the

Frenchman dines on roast goose. He thus marks his disapproval of the perfidious conduct of the animal, and keeps green the memory of the saint.

THE BLACK-LETTER BROADSHEET.

I HAVE always had a great horror of circumstantial evidence. Now and then it has fallen to my lot to serve on juries at assizes or petty sessions, and on these occasions I have sometimes had to deal with cases where the evidence against the accused persons was built up bit by bit until it seemed conclusive. My fellow-jurors usually made up their minds as readily in such cases as in those where testimony was direct; but they never succeeded in persuading me to agree to a verdict. I daresay I was often laughed at and ridiculed, but that mattered nothing. I had a very good reason for refusing to convict on circumstantial evidence only, and it was on that account that I steadily refused to assume the guilt of a man who seemed to be guilty, but who might nevertheless be innocent of the charge laid against him.

I have all my life been a student, devoted to books and to literary research, and when I was quite a young man my special form of pleasure was the unearthing of anything in the shape of black-letter folios, pamphlets, or tracts. In my own modest way I had quite a decent collection of this sort of literature by the time I came of age, and every separate volume or tract in it had been collected by myself. I had unearthed my treasures from all sorts of places: some from between the pages of dirty and dog-eared volumes picked up on old bookstalls; some from old houses in the country; others from sales at which neither bookseller nor antiquary was present to dispute the prize with me. I was very proud of my little collection, and would not have sold it for its weight in gold. My one aim in life at that time, in fact, was to add to it, and I was always on the outlook for any rare volume that promised to enrich my stores.

In the summer of the year 1861 I was staying at a little village in the West Riding of Yorkshire, whither I had gone for the sake of fresh air, solitude, and such other delights as the country can give. I had my black-letter collection with me in my lodgings, together with a small library of my favourite authors, and in this congenial company I was never at a loss for occupation and amusement. I suppose the villagers soon heard of my bookish pursuits, for they bestowed upon me the name of 't' owd-book man,' and looked at me with considerable wonder. They themselves had old books in their farm-houses and cottages, and let me overhaul them gladly; but though many of them were curious and rare, I found nothing in my own special line.

One evening, however, as I was sitting in my lodgings reading John Lilly's *Euphues* for the fiftieth time, my landlady ushered in a young man whom I knew as John Burton, a stout farm-labourer. He stood inside the door twirling his cap and staring at the books around him.

'Good-evening, John,' said I. 'What can I do for you?'

'You're varry fond o' owd books, aren't you, mestur?' said John in reply.

'Certainly I am,' I replied, wondering what he meant. 'Yes, very fond indeed.'

'I thowt,' said John, 'at you'd happen hev no objection to buy two or three owd books 'at I hev to sell. You see, mestur, I'm emigratin' to America, and it's no use me carrying owd books wi' me, so I want to sell 'em if they're worth owt. I hev heerd 'at owd books is sometimes worth money.'

'Quite so, John. Well, I'm afraid you won't have anything that will suit me; but I'll look at them and tell you what to do with them.'

'Thank 'ee, sir,' said John. 'They're varry owd, is some on 'em. They were my grand-feyther's at first. Then I'll fetch 'em for you to look at, sir?'

'Yes, fetch them, John, by all means. I'll do my best for you.'

He came back in twenty minutes, bringing an armful of books, which I spread out on the table and began to examine. There was nothing amongst them that seemed likely to be of use to me. An old work on farriery, another on agriculture, a quaintly illustrated *Pilgrim's Progress*, a collection of tracts bound together, an old Bible—these were the principal features of John's little library. There was nothing that I cared even to examine except the tracts, which I began to turn over on the chance of finding something curious amongst them.

'I'm afraid your books won't be of much use to me, John,' I began—and suddenly stopped short. In turning the book over I had caught a glimpse of black-letter! My heart gave an extra beat: I tried to assume a careless manner. Book collectors will know what I felt. I turned the leaves carelessly again, and saw that what had caught my eye was a black-letter broadsheet or tract which had evidently been slipped into the book ages before. I laid the volume down. 'However, I'll tell you what I'll do, John,' I continued, as calmly as possible. 'As long as you're going to America and don't want to carry your books with you I'll give you five pounds for the lot. Will that suit you?'

It suited John very well indeed; and he presently retired with five golden sovereigns knotted securely in the corner of his handkerchief.

'Look here, John,' said I, as I showed him out; 'don't tell any of your neighbours that I have been buying books from you. I really don't want to buy any more, and they might come to offer me some.'

'All right, sir,' said John. 'Good-night, sir, and thank 'ee.'

When he had fairly retired, I slipped the latch of my door and sat down to examine my purchase. It might be worth something, or it might be worth nothing. I turned over the leaves and taking the broadsheet out laid it on the table. I think that was the most supreme moment of my life. Before me lay what I knew to be a perfect specimen of Caxton's own work—a little tract of four pages, printed by the master's own hands. It was in beautiful preservation, without a crease or a wrinkle, and the dead black of the ink seemed as fresh as if it had just come from the press. What a wonderful piece of good fortune!

Now, I knew a good deal about that particular broadsheet. A copy of it had been sold at Quaritch's only a few months previously which was supposed to be absolutely unique. It had fetched a tremendous price—four hundred and twenty pounds, I think. The purchaser was a famous collector, Dr Clarke, whose special love was for unique copies, over which he had spent a fortune. He had been very jubilant over his acquisition of the famous broadsheet, and I hugged myself with delight at the thought of his discomfiture when I showed my copy to the learned world.

Book-collecting, I think, leads men to the cultivation of very subtle and ingenious diplomacy. It develops cautiousness and control, and makes a man as Machiavellian as an ancient Italian statesman. No sooner had I secured my priceless broadsheet than I began to lay schemes for getting a peep at Dr Clarke's copy. I had never seen it, for I had not known of the sale at which it was disposed of until too late. Dr Clarke lived at Lichfield, and I immediately determined to beard him in his den and beg for an inspection of his Caxton tract. I would examine it narrowly, and then, when he was glorying in his possession of it, I would confound him by producing my own. I rubbed my hands gleefully at the mere thought.

I wrote to Dr Clarke the next day, asking him to allow me to inspect his chief treasure. I reminded him that I had once met him at the house of a mutual friend in London, where we had exchanged views on the questions interesting to both of us. I explained that I had never seen the broadsheet now in his possession, and should be very glad of his permission to examine it. By return of post came a letter from Dr Clarke giving me leave to inspect the treasure, and fixing the following Monday for an interview at his house. It was then Thursday, and I spent the intervening days in a fever of impatience. There was a hope strong in my heart that Dr Clarke's copy might prove to be faulty in some respect, or not so clean as my own. In that case my copy would hold pride of place.

I travelled to Lichfield very early on the Monday morning, and presented myself at Dr Clarke's house to the very minute. Alas! the doctor had been obliged to leave home an hour previously, and would not return until late that night.

'But if you are Mr Simpson, sir,' said the servant, 'my master left a note for you.'

I opened the note eagerly. Dr Clarke regretted that he was called away to see his dying sister. Rather than disappoint me, however, he had given instructions to his daughter to show me the Caxton, and he trusted I should make myself at home in his library during my stay there.

This was quite satisfactory to me, and I was presently ushered into the presence of Miss Clarke, a pretty, clever-looking girl of nineteen or twenty, with whom I was soon chatting at my ease. I found her quite as enthusiastic on the subject of book-collecting as her father. She took me into the doctor's library, a fine noble apartment; and after I had glanced round the shelves, she installed me in her father's chair and unlocked a drawer in his desk.

'Here is the pearl of great price, Mr Simpson,'

she said laughingly. 'You see how jealously we guard it—how carefully it is wrapped and protected. There—now examine it at your leisure. You will excuse me, I am sure. When you have finished your inspection, please replace the packet in this drawer. We lunch at one.'

She went away; and I opened the packet with trembling fingers and carefully laid aside the wrappings until the Caxton was revealed.

I was very much surprised by it. It was an exact counterpart of mine, just as clean, just as unwrinkled. It looked as though it had been preserved for centuries in very careful fashion. There was no doubt that between my copy and it no material difference existed. I began to go over it carefully with a magnifying glass.

While I was engaged on the second page, Miss Clarke again entered the room. After some slight chat about the Caxton, she asked if I had seen her latest purchase. I had not; and she unlocked another drawer and produced it. It was North's Plutarch, a beautiful specimen, which we duly examined and praised. Then she went away again, and I was alone until my examination of the Caxton was finished. I had been carefully through it and could find nothing different in it from my own copy.

I wrapped the treasure up again, and replacing it in the drawer, locked the latter, and took the keys to Miss Clarke in the adjacent drawing-room. I wondered whether or not to tell her of the existence of my own copy. Finally, I decided not to do so. I could not resist the temptation of making the announcement to Dr Clarke in person. I remained to luncheon, and immediately afterwards took my leave and returned to Yorkshire.

About four o'clock in the afternoon of the next day I was sitting in my lodgings re-examining my copy of the Caxton tract when I heard a loud knock at the door. Before I could rise from my desk, the door opened, and two gentlemen, one of whom I recognised as Dr Clarke, strode into the room. I hastily laid some papers over the tract and rose to meet them.

'Mr Simpson,' said the doctor, who was obviously excited, 'what have you done with my tract, sir?'

I stared at him with wide open eyes and mouth. Done with his tract? Whatever did he mean? I glanced from him to the other man, who was cool and unconcerned, and was looking round the room with sharp, but apparently careless eyes.

'Done with your tract, Dr Clarke? I have done nothing with your tract. What should I have done with it?'

The doctor's excitement increased. His face grew red, then purple. 'Don't prevaricate, sir!' he thundered. 'You come to my house—almost a stranger, and examine my tract. When you are gone, I return, and find my tract gone too!'

'Gone! my dear sir!—I locked it up myself.'

'It is gone, sir, gone, I tell you. I went to the drawer this morning, and found it had disappeared.'

'Oh!' I said. 'This is sheer nonsense, Dr Clarke. I tell you I locked it up in the drawer, and returned the key to Miss Clarke.'

'Little fool that she is!' said the irate doctor. 'Why didn't she sit by you and keep her eyes

on it? I tell you, sir, it's gone—and I want to know what you've done with it—Now, then, straight out, where is my tract?'

I stared at him, helpless and amazed. While I struggled to find words in which to answer him, the quiet man stepped forward and lifted the sheet of blotting-paper which I had thrown over my own Caxton. There it lay! Dr Clarke nearly screamed: I felt as if I were going mad.

'This the article?' said the quiet-looking man.

'My tract!' said Dr Clarke, and seized it carefully. 'Oh, what depravity on your part, Mr Simpson! To steal my tract, and then tell lies over the matter.'

I lost my temper at that. 'Confound you, sir!' I cried. 'Mind what you are saying. That tract is mine, sir; mine, I tell you! Put it down this instant. I bought that tract a week ago, and came to see yours, so that I could compare the two. I tell you it's mine.'

The quiet-looking man smiled and shook his head. Dr Clarke grew apoplectic. Then he assumed a dignified air.

'Mr Simpson,' he said, 'if you had made confession and returned the tract willingly, I would have forgiven you. Your conduct, sir, is base in the extreme. Another copy of this priceless work! Sir, you know that my copy is absolutely unique. No, sir; I cannot look over this. You must be punished.—Officer, do your duty.'

It was all in vain that I protested, exclaimed, threatened, and beseeched. Dr Clarke was inexorable. I suppose I had made matters worse by doubting the uniqueness of his tract. He stood by, firm and resolute, while the detective formally arrested me, and warned me that whatever I might say would be used against me.

I was conveyed to the Town Hall at Radford, six miles away, and locked up for the night. What a terrible position to be placed in! How I wished again and again that I had shown my tract to some one before going to see Dr Clarke's. The evidence against me seemed terribly convincing. What could have become of the doctor's own copy? I knew I had locked it up again, and given the key back to the doctor's daughter. If it could not be found, whatever would happen to me? I should be sent to jail like a common thief, and I should lose my black-letter broadsheet into the bargain.

During the evening I sent for the leading solicitor in Radford and retained him for my defence. I made a clean breast to him of everything connected with the case. He listened attentively and closely, but his face grew graver every minute, and he shook his head when I had done.

'I am very sorry indeed, Mr Simpson,' said he, 'to have to tell you that matters look very dark from our side. You say that the man from whom you purchased the books is on his way to America, and that if he were here he could not prove your possession of the tract. You also say that there is a general opinion amongst experts that Dr Clarke's copy was unique. You had not mentioned your copy to any one, not even to Miss Clarke. You see how all this will tell against you.'

'For Heaven's sake!' said I, 'tell me what we must do.'

'I will go and see Dr Clarke at his hotel. You will be brought before the magistrates at

ten o'clock to-morrow. Between now and then I may be able to arrange something.'

But he returned in an hour to say that Dr Clarke was as firm as adamant. He scouted the idea of a second copy, and flew into a rage when my solicitor pressed the matter. He seemed to think that I had made a deliberate plot to rob him of his chief treasure, and nothing that my advocate could say would stir his resolve to press the charge against me.

I had no sleep that night, and I daresay I looked haggard enough when I was put into the dock next morning. Rumours of the case had got out, and the court was crowded. I tried to shrink from observation, knowing all the time that every eye was on me. My frightened air no doubt told against me: at anyrate it seemed to me that everybody in court looked at me as though I had committed every crime in the calendar.

I pleaded not guilty to the charge, and, on my solicitor's advice, elected to be tried summarily. I wanted to get the matter over, so that I might escape from the staring eyes around me. I stood in the dock and listened to the evidence. How very clear and direct it seemed! I could readily understand how guilty the magistrates must think me. And the worst of it was, I had absolutely no evidence to offer in defence.

Dr Clarke deposed that I wrote to him requesting permission to examine his Caxton tract, which was absolutely unique. I received that permission, and attended at his house on the day agreed upon. He was away that day; but when he returned home next morning his daughter told him of my visit. He went to the drawer where the tract was usually kept, and found it missing. He then came down to the village where I was living, and brought a detective with him. They found the tract—produced—on my desk. He absolutely and without doubt identified the tract so found as his own.

Miss Clarke, who gave me a very sorrowful look as she entered the witness-box, gave evidence as to my visit to her father's house, and my examination of the tract. She received the keys of the desk from me, and understood that I had restored the tract to its place. She did not consider it necessary to look at the tract after I had left, but was with her father when he discovered the loss next morning. The keys meanwhile had not been out of her possession.

The detective proved the finding of the tract on my table, and his evidence concluded the all too strong case against me. I felt a deadly sinking of heart as my solicitor, who had made out nothing in cross-examination, rose to address the court. He put my story before them as clearly and strongly as possible; but he had no witnesses to support his statements, and it was very easy to see that nobody believed him.

The magistrates were not long in coming to a decision, and their chairman addressing me, said that he was deeply grieved to find a person of my position and education occupying so shameful a place. Unfortunately, this was not the first time that collectors of curiosities had been so overcome by covetousness that they had stolen things which belonged to brother-collectors. They would make allowance for temptation, but they could not forget that I had added to my

guilt by gross deceit. All things considered, they must send me to prison for—

But before the chairman could finish, he was interrupted by the entrance of a messenger, who handed a telegram to Dr Clarke. The doctor tore it open and turned first white and then red. 'It's found!' he shouted, regardless of legal etiquette. 'It's found—and, by George, there are two copies after all!'

The explanation was very simple. I had put away Dr Clarke's tract in the drawer which contained his daughter's Plutarch, and it had never occurred to her to examine it. She had left the keys in it, and I had thought it the drawer from which the tract was originally taken. So I got my liberty and my black-letter broadsheet back again. I was inclined to be very angry with Dr Clarke, for I thought he had acted too hastily; but his daughter was so tenderly compassionate towards me, and so full of remorse for her carelessness, that I forgave him, and was shortly afterwards rewarded for my forbearance by the gift of herself in marriage.

THE MONTH: SCIENCE AND ARTS.

WHEN the giant planet Jupiter is examined with even a small telescope it is seen to possess four moons or satellites. These were discovered by Galileo in 1610 and for nearly three centuries the correctness of the observation has remained undisputed. Moreover, four appeared to be the proper number of moons for Jupiter to possess, for it seemed that there was a kind of law by which such satellites doubled in number as their primaries were more remote from the sun. Thus, the Earth has one moon, Mars two, Jupiter has been credited with four, and Saturn with eight; but a fifth moon belonging to Jupiter has now been discovered by Professor Barnard, of the Lick Observatory, California, where, as we all know, there has been erected the most powerful telescope yet made. The new satellite is no brighter than a thirteenth-magnitude star, which will perhaps account for its escaping the scrutiny of previous observers, and it has a period of revolution of a little more than seventeen and a half hours. We need hardly point out that this is one of the most important astronomical discoveries which have been recorded for some time.

It is said that the passage of boats containing naphtha on the Volga has had the effect of poisoning the waters of that river. The quantity of naphtha conveyed in this manner increased from thirty-two million kilograms in 1887 to nearly fifty millions two years later. A great deal of this volatile liquid is transported in badly built wooden barges, with the result that there is a loss by leakage of about three per cent. As a result of this the fish are decreasing rapidly, and in certain places where the boats stop they have become extinct. The naphtha has also had the effect of killing off the insect life upon which the fishes feed, for in flood time the water invades the adjacent meadows and destroys the larvæ. It is said that those fish which are not actually killed are quite uneatable through being impregnated with the flavour of naphtha.

A very interesting experiment has lately been

made in the importation from the antipodes of flowers imbedded in ice. It seems that of late years the culture of the chrysanthemum has aroused much interest in New Zealand, where the season for the blooming of these flowers occurs in April instead of in November as at this side of the world. A gardener living at Wellington lately took some of his finest flowers to a meat-freezing establishment, where they were placed in tin canisters, filled with water, and afterwards frozen. These tins were lately opened in London, when the flowers, in perfect condition and preserving both shape and colour, were found imbedded in a cylinder of pure crystal ice. This is, we believe, the first attempt which has ever been made to transport flowers in a frozen state.

There are in all countries many would-be inventors who are frequently deterred from bringing the results of their ingenuity before the public because of the cost of taking out a patent specification. Most inventors know that it is very little good to patent an invention in one country only, because infringement in a foreign land is almost sure to follow; but we venture to think that few persons are aware of the great expense involved in protecting an invention all the world over. This expense has lately been incurred by the patentees of a hypodermic syringe. There are sixty-four countries where an invention can be patented, and the aggregate fees payable for official protection amount to no less than three thousand six hundred pounds.

We have more than once called attention to the fact that lighthouse lanterns form a great attraction to birds of all kinds, who dash themselves against the glass, and are often found dead in great numbers round about the building. The establishment of the electric light at a certain place in Kansas, which is the resort every season for wild geese, has had the effect of attracting a number of those birds to the spot. They fly towards the lamps and are killed in great quantities, so that an early riser may be quite sure, by patrolling the streets before daybreak, that he will provide himself with a good dinner.

According to a correspondent in *Nature*, the Cornish Pilchard fisheries have been infested this year with large numbers of blue sharks. These creatures measure from four to nine feet in length, and render the fortunes of the fishermen very uncertain by driving the shoals of pilchards in different directions. The fishermen also complain that their property suffers great destruction from the unwelcome visitors, whose sharp teeth bite through the nets in their efforts to get at the fish contained therein. One fishing-boat lately caught seven of these sharks, and the master declared that he could have caught a dozen or more had he so wished.

A curious instance of the effect produced upon animal life by the deprivation of light has lately been discovered in the reopening of an old mine in California. In a passage connecting two shafts, the explorers found a number of flies, which were perfectly white except the eyes, which were red. They also found in the same passage a white rattlesnake. The place where these creatures were found was perfectly dark but dry, and well supplied with air. The snake was at once killed, but the flies were taken into open

daylight, and put in a glass case, where they resumed the ordinary colour of house flies in the course of a few days. It is supposed that the flies were the descendants of some which had been imprisoned in the mine thirty years ago, and that the snake had, when young, been washed into its subterranean abode by heavy rain.

A horticultural paper raises the question, whether the ant is a friend or foe to the fruit-grower? It is certain that in this country every effort has been made to destroy the little insect, but it is not so in Southern Germany and Northern Italy, where the ant—the black ant more especially—is held in high esteem, and precautions are taken to promote its increase. It is said that the place in the orchard where apple and pear trees are freest from blight and insect ravages is always in the neighbourhood of an ant-hill.

Among the big things which are to be shown at the big fair at Chicago will be the biggest gun on earth—the latest child of the ordnance factory at Essen. This Krupp gun is to be about eighty-seven feet long; the largest American guns at present made being about half that length. A railway track will have to be constructed to carry it to the exhibition grounds, and a special foundation laid there to bear its enormous weight. It is calculated that if it were fired when placed in that position, the immediate result would be the breaking of every pane of glass in Chicago, while the projectile thrown would travel a distance of from fifteen to eighteen miles.

One of the most recent applications of steel is in the construction of a chimney three hundred and fifty feet in height, in the City of Chicago. For seventy-five feet from the ground the chimney is lined with firebrick, and above this it is lined with hollowed tile. The thickness of the metal varies from five thirty-seconds of an inch at the top to three-eighths of an inch at the bottom, and at intervals of twenty-five feet the lining receives support from angle irons riveted to the steel shell. The outside diameter of this unique chimney is nine feet five inches. If it had been constructed of brick in the ordinary way, its required measurement would have been sixteen feet six inches.

A curious observation was lately made by an American naturalist, Mr J. M. Wright. He noticed one morning a cat sitting on a window sill near a pine tree, upon a branch of which a bird presently alighted. Upon this bird the cat seemed to concentrate its attention, gazing at it with peculiar intensity of expression, while at the same time the fur on its head stood erect; otherwise the cat was perfectly motionless. The bird seemed to be fascinated by the animal's gaze: it trembled, and after a feeble motion of the wings, fell down towards the cat, which immediately pounced upon it. Mr Wright is inclined to regard this as a case of hypnotism, a theory which would also explain the powers of fascination with which snakes have always been credited.

Mr Flinders Petrie, whose Egyptian researches have already led to such valuable results, has after a two-years' study of the subject at Gizeh, come to the conclusion that the Egyptian stone-workers of four thousand years back must have had an intimate acquaintance with what we generally consider to be modern tools and methods

of working. Among the many appliances used by them was the lathe, both solid and tubular drills, and straight and circular saws. The drills, like those of the present day were set with jewels, and were capable of cutting to the depth of a tenth of an inch in the hardest granite at each revolution. It is evident too, from an examination of the stone, that the tools were of such fine quality that they preserved their sharpness for a very long period.

In the President's address to the British Pharmaceutical Conference which met lately at Edinburgh, interesting reference was made to the great Scotch industry which has grown up of recent years in the production of shale oil. The shale—which was formerly regarded as useless, is now converted into paraffin, lubricating and burning oils, and ammonia. There are two and a half millions of capital invested in the trade, the extent of which can be realised from the fact that fifty-five million gallons of crude oil were last year distilled from 2,311,592 tons of shale. This vast industry, curiously enough, led to the establishment of another totally different branch of commerce; for in devising refrigerating machinery for condensing the volatile products of the shale, Mr Coleman was led to the discovery of the celebrated Bell-Coleman Refrigerator, with which ships are now fitted, and by which the immense trade in frozen meat from abroad has been rendered possible.

It will be remembered that some months ago there was much talk of certain rain-making experiments in Texas, heavy showers having been said to be produced by the explosion of shells projected to high altitudes. In order to settle the question whether there was any truth in the reported successful results of these experiments, the United States Government appointed a rain-making expedition, and devoted nine thousand dollars to its equipment. Mr George Curtis, meteorologist to this expedition, discusses in one of the New York magazines the conclusions at which he has arrived. He says that the experiments have utterly failed to demonstrate that explosions can develop a storm or can produce a measurable amount of rain; but he records one fact of scientific interest. In several instances, he reports, when a dense and threatening cloud was overhead, the explosion of the shell was followed, after an interval of twenty or thirty seconds, by a perceptible sprinkling of rain; but this of course was not what the experiments were designed to accomplish. Charlatans have not been slow to take advantage of the rain-making excitement, and artificial-rain companies have sprung up in many places, and have made money by pretending to sell rights for the use of much-vaunted appliances over which they have acquired control.

A balloon of novel design has recently been patented. Its shape is that of a hollow open ring, which is divided internally into a series of gas-tight compartments, so that if one compartment were ruptured or pierced by a bullet—in the case of the balloon being used for military purposes—the other compartments would remain intact and would keep the apparatus floating in the air. Another new feature in this balloon is a removable cover which envelops the ring, thereby causing it to assume the form of a parachute, and

thus to insure slow and steady descent. Should the balloon fall into the sea, it will act as a gigantic life-buoy, which in shape it so much resembles.

The rabbit pest is once more coming to the front as a question of the day in New South Wales. It is now proposed to build a brick wall around certain portions of the colony, so as to enclose the rabbits as in a huge ring-fence. It seems that these animals never burrow to a greater depth than thirty inches from the surface, and the proposed wall is to extend that depth into the ground. When once it is built, a general extermination of the rabbits within the enclosure will at once be carried forward.

Although we hear a great deal of the ravages caused by the rabbits both in New Zealand and Australia, we should not forget, as has been lately pointed out, that there is another side to the question. A very large number of persons owe their means of livelihood entirely to the presence of poor bunny. For instance, a killer gets two cents per head royalty from the Government for destroying the creature; he then sells the skin for about double that sum, and he can also sell the meat to the factory which tins it for export to Europe. The skins are mostly exported to London, and represent an important business. It is now acknowledged that Pasteur's attempt to exterminate the rabbits by inoculation with the virus of chicken cholera was interfered with by those interested. Finding that his efforts lacked support, the French savant stopped his agents from experimenting further.

A new method of giving ships' bottoms a coating of copper has, it is said, been lately tried at New York with success. The method employed is as follows: The vessel is put into dock, and the entire hull is surrounded at the water-line by a bag made of watertight canvas supported by a network of wire; in the bath so formed is placed a quantity of sulphate of copper solution; and metallic copper is deposited from this solution upon the ship's plates by means of the electric current generated by a dynamo-machine.

Opticians, surgical-instrument makers, needle manufacturers, and others who deal with goods of polished steel have often good cause to deplore the loss occasioned by rust. It is well known that the oxygen contained in perfectly dry air is harmless in this respect. If, therefore, we can deprive the air having access to steel of its moisture, the metal will remain bright. This can easily be done when the articles to be treated are kept, as they generally are, in a closed case, by associating with them a substance such as chloride of calcium, which is greedy of moisture. A simple way of doing this has recently been published. The lumps of chloride are put in a glass funnel standing in a small bottle, so that as the calcium attracts moisture from the air, the water generated drops into the bottle. The calcium will remain active for a long period.

A correspondent of the *Scientific American* describes a curious effect which was produced on ordinary leaden bullets by firing them through a paper target backed by one thickness of cotton sheeting, the bullets having been picked up in the snow behind the target. These bullets were found to bear upon their faces a distinct impression of the surface of the cotton cloth, in which could be traced every thread of the fabric. The

range was two hundred yards, and the bullets were fired from breech-loading rifles with heavy charges of powder. 'It is possible,' writes the observer of this phenomenon, 'that the tremendous velocity of the bullet made the impact equivalent to the blow upon a stationary and immovable object, or that a small piece of the cloth may have been punched out, and going forward with the bullet, was impressed between the projectile and the snow.'

There is now good reason to hope that owing to the rigorous measures taken we shall in this country escape the threatened epidemic of cholera, but it may be that we shall have a recurrence of the threatened invasion during the spring and early summer of next year. Those who have made a study of epidemic diseases are of opinion that the unwelcome visitor may possibly make a more serious onslaught at that time, and they speak from experience of what has occurred before. There is no doubt that the germs can remain in the soil in a dormant condition for a long period, and are ready to break out when circumstances favourable to their development are brought about. It will therefore be well for heads of families not to abate any of the precautions which they have been taking. Let them remember that the great enemy of cholera is found in cleanliness and moderation in all things.

A curiosity has been submitted to the editor of the *Lancet* in the shape of a living creature which was found inside a tinned pine-apple. This creature is supposed to be the larva of some beetle the species of which has not been accurately ascertained. The fruit is supposed to have been boiled at Singapore before it was tinned; but it is more probable that the cooking operation was not carried on at a temperature high enough to kill the larva; indeed, we may assume that the temperature of boiling water would inevitably spoil the fruit.

A Swedish engineer has invented a new form of lucifer match. This match is described as being like the rolled-up tape measure enclosed in a metal cover which is used by tailors, surveyors, and others. The roll in this case is made of paraffined paper, and at regular intervals upon it are small projections, upon which the igniting chemical composition is placed. One end of this paper projects from the metal case, and on pulling it out quickly, the material upon it rubs against a small steel plate, and a lighted match is the result. When the material is exhausted, a fresh roll of paper can be inserted in the same case. The manufacture of the new article is said to be very much more simple than that of the old wooden match which it is designed to supersede.

It is well known that mosquitoes and many other insects deposit their larvæ in water. In Siam a very simple remedy is adopted to stop their operations. It is common there to collect water in open vessels during the rainy season in sufficient quantity to last until the next year, and the water is commonly kept in unglazed earthen jars of large capacity. To prevent the mosquitoes depositing eggs in the water, a couple of large wrought-iron nails are heated red-hot and dropped into each jar. This simple remedy, which is said to be quite effective, is described in one of the American technical papers by a resident at Bangkok, Siam.

During September some very interesting archaeological finds were made known. Rochester—where there are very early remains found from time to time—has yielded up three Anglo-Saxon graves in a good state of preservation. Besides the skeletons, there were found in the first grave a spear-head of iron and a knife; in the second, a knife; and in the third were stowed away a buckle, some glass beads, a small urn, and a knife. Mr Payne, F.S.A., thinks that, from the care with which the interments have taken place, these graves must have formed part of the necropolis of Anglo-Saxon Rochester.

Professor Gamurrini, writing from Novellara, near Pesaro, believes that he has discovered an ancient Etruscan burying-place of about the year 700 B.C. Eighty skeletons, all representing persons of unusual size, have been exhumed. Their height varies from five feet eleven inches to six feet six inches; the teeth are even now in a good state of preservation, and are white and strong. The bodies had evidently been buried in a crumpled attitude, and lying on their sides. With them were interred the usual accompaniments of lances and bronze ornaments, and in some of the graves were found ornaments of amber.

Near Simferopol, Professor Wesselowski has come upon an ancient Scythian tomb. The tenant was evidently a soldier; by his side were a sword and a coat of arms; at his feet lay an iron knife and two lances. On the head was a cap on which was a gold ornament. In the tomb there were also found some amphoræ and the bones of an ox. Near the head of the skeleton—which lay facing the east—was a leathern quiver, on which was a gold plate richly worked, representing an eagle with outspread wings carrying an animal in its talons. The arrow-heads were of copper.

FAIR AS A ROSE.

Why art thou like this pale pink rose,
That in the verdant hedgerow grows?
Its petals to my lips I press
As I thy pink cheeks would caress;
The yellow heart its leaves enfold
Recalls thy heart of purest gold;
The dewdrop that upon it lies
The sparkle of thy tender eyes;
The briar-sweet from which it springs,
The perfume that around thee clings,
And as its sweets allure the bee,
Thy winsomeness doth capture me.

G. D. L.

** TO CONTRIBUTORS.

- 1st. All communications should be addressed to the Editor, 339 High Street, Edinburgh.
- 2d. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3d. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.
- 4th. Offerings of Verse should invariably be accompanied by a stamped and directed envelope.

THE ORIGIN OF THE OPERA.

By J. F. ROWBOTHAM, Author of *The History of Music*.

THE first Opera ever heard in Europe was the opera of *Daphne*. It was performed in the year 1594, and was considered such an oddity by those who heard it, that there were not wanting people to exclaim loudly against the introduction of such a foreign and 'utterly unnatural drama,' as they were pleased to call it. The absurdity that the performers should sing their lines instead of speaking them, should fence and fight to the accompaniment of music, and even at the point of death should have a chorus standing round them, bewailing in alto, tenor, and soprano their woe, seemed a little too much for the gravity of many people; and the first opera was the butt of jeers, criticism, and ridicule. It was, in fact, a bold experiment on the part of a few cultivated men to revive in modern Europe the drama of the Greeks. The Count di Vernio was one of the most cultured men of his time, in an age of great refinement, when, it may be added, even ladies could read and write Latin, and many of them understood Greek. He himself, an excellent scholar, and a man of princely hospitality, threw open his house to all the learned men and great artists of Florence. The Count's Palace was a very gallery of antique art. Sculptures belonging to the best days of Greek art lined the walls; rare and costly paintings were to be seen in profusion; and side by side with the marbles of Praxiteles and Polycletus were to be found ancient manuscripts of untold value, obtained from the refugees of Constantinople, when that capital was sacked by the Turks, treating of the theoretical principles of Greek sculpture, painting, and music. There were weekly gatherings at the Palace of all that was learned and talented in Florence. It was the Count's custom to receive his guests in his hall; and then to take them round his galleries, hearing their criticisms of any new work he might have added recently to his treasures; or, in the case of those who now for the first time looked upon the wonders of the Palazzo Vernio, listening with

delight to the expressions of wonder and admiration which burst involuntarily from their lips. After the tour of the gallery was over, it was the usual practice for some one of the company to recite a poetical composition, while the others gathering round listened with attention, but at the same time with that attitude of mental reservation which a strongly developed faculty of criticism is likely to cause. After the poem was over, there was invariably a critical discussion of its merits.

Little by little it had become plain to these cultured *habitués* of the Palace that the best experiments and emulation of the poetic art of antiquity left something to be desired. There was still a deficiency felt, but not definitely understood, even when the odes of Pindar had been reproduced in Italian syllable for syllable; even when the poems of Sappho had received a complete and plastic transcription in the Tuscan dialect.

At last it was suggested, and suggested rightly, that ancient poetry was always accompanied by music. When Sappho would deliver one of her poems, she was not accustomed to recite her lines as an actor or an elocutionist at present, or as one of the poets who in Count Vernio's house repeated his latest effusion. She took a lyre in her hand, and striking the chords, sang her poetical lines in a sweet and impassioned voice, the effect of which, added to the charm of the poetry, produced that wonderful impression on her hearers which all antiquity testifies to. In the same way Pindar entrusted the delivery of his odes to a chorus of vocalists, who danced while they sang. Here, then, was the secret of the Greek poetical art at once laid bare, and it remained to be seen how far the poets and dilettanti at Count Vernio's gatherings could take advantage of it.

In the first place, the poets acknowledged a great and insuperable difficulty at the outset: none of them could sing. How, then, would it be to depute choruses of vocalists to sing the songs in the manner of Pindar and his chorus? And from this suggestion the way was not very

long to that other proposal, which seemed but the natural sequel to the former—why not attempt the revival of that organised form of chorus and solo which was known as Greek tragedy, and which would be sure to attract public interest by the charming union of not only poetry and music but also of scenic display? Accordingly, one of their number was deputed to prepare a dramatic poem written on a given classical subject in the style of Sophocles, and a musician was commissioned to set it to music.

The tragedy of the Greeks, which was now to undergo the experiment of a revival in Europe, had been the growth of centuries in the classical clime wherein it was a native. The theatre was so arranged that the actors should stand on a high stage, furnished with scenery and all other requisites, while a distinct body of performers, called the chorus, had their place in what we should call the pit, but which the Greeks called the orchestra—a large flat circular enclosure, larger than the arena of any modern circus, and reaching from the verge of the stage to the rim of the lowest tier of benches which surrounded the enclosure. Here the chorus, who supplied both music and action to the development of the drama, had their traditional place.

The flimsy contrivances of gauze and canvas which do duty for scenes in a modern theatre were very far from satisfying the artistic nature of the Greeks. If the exterior of a house was to be represented, the façade would be built up with huge blocks of wood, painted to resemble stone. If an interior were portrayed, solid walls and massive furniture would be seen on the stage. For open-air scenes, the scenic artists endeavoured as far as possible to bring in the resources of nature to their aid; and as there was a park at the back of most theatres, the eyes of the spectators were regaled with real trees, real emerald turf, and sometimes real waterfalls plunging down a rock. The theatre itself had no roof; the performances took place in broad day, with the sun shining overhead, and the blue sky beaming down on the spectators.

The tragedy commenced by the curtain rolling down—it sank on rollers into the stage, while ours rises up to the flies—and revealing the scene in all its beauty to the spectators. Then the sound of instruments was heard, and the chorus, four or six abreast, marched in military order into the orchestra. They played flutes and lyres as they walked, the tune generally being a military march, to the sound of which they performed various martial evolutions in the orchestra, and then grouped themselves round the altar which rose in the midst of the large arena. When they took their place at the altar, the tune of the march ceased, and some sitting, some standing, in an attitude of classical repose, they commenced the overture to the tragedy.

The overture concluded, the actors would appear

on the stage, and while the chorus assumed a statuesque tranquillity round the altar, would declaim their lines in a sort of sonorous recitative, accompanied with occasional notes or chords on the lyre. This method of singing their parts, instead of speaking them, was in a manner forced upon the performers by the immense size of the theatre. The great theatre of Bacchus in which the tragedies took place accommodated with ease from thirty to forty thousand spectators. No elocution, however distinct, could reach the ears of the tenants of the farthest benches, or even be audible half-way through the immense throng. The actors, therefore, were compelled to chant their parts in order to make their voices carry the requisite distance. They were aided in this endeavour by a sort of miniature speaking-trumpet, which was fixed inside the waxen mask which they invariably wore, and which multiplied the natural tones of their voice to such a degree that they could send their monotonous recitative rolling through the theatre. After their dialogue and action had lasted a certain time, they left the stage; and the chorus, striking up their flutes and lyres, commenced a highly musical and melodious song, to the accompaniment of which they danced in mazy rings through the orchestra. The beauty of their dances was universally acknowledged, and arose presumably from the exceeding care in the preparation of them. Sculptors and painters came to assist the chorus-master at the rehearsals, and to suggest artistic and striking poses for the dancers. The weavings and interweavings of the lines of dancers were the subject of the most careful consideration on the part of their trainers; and the whole orchestra was traced with intricate patterns in chalk, over which the dancers plied their feet according to a preconcerted plan.

The choral dance over, once more the actors entered the stage, and in such alternate appearances of actors and chorus the structure of the play consisted.

Such was the highly artistic and finished form of musical composition which Count Vernio and his friends designed to revive in Italy, and it remains for us to see how they succeeded in their task.

A performance on so gigantic a scale as the Greek tragedy was plainly out of the question, since there was neither the place nor the public to make such an innovation possible. The only places ever open to dramatic performances, or 'shows,' as we should more properly call them, were the halls of the nobility. There were no theatres except of the roughest kind, where the mysteries and moralities were performed; and there was no public able to appreciate aught of a refined nature except the nobles, and they preferred to confine all such representations to their own house. At banquets and at fêtes it was often the custom for a rich nobleman to offer to his friends a pageant. The awning at one end of the banquetting-hall would suddenly be lifted up, and would reveal an emblematic figure of Victory. A flourish of trumpets would announce the entry of another character—this would perhaps be a woman clothed in pure white, with a crown on her head, to represent Virtue. After sundry gestures had been gone through by these

two chief actors, Virtue would embrace Victory. Next, a figure hideous to behold, representing Crime, would be introduced, surrounded by a crowd of imps, symbolical of the Vices. Crime would endeavour to participate in the fraternity established between Virtue and Victory; but after many attempts and many useless seductions, he would be forced to retire, baffled, from the scene, amid the uproarious applause of the spectators, and to the complete satisfaction of everybody present, who saw in such a finale a very natural termination of the drama, and were so accustomed to simple entertainments, that they never desired anything stronger to stimulate their theatrical palates.

Count Vernio and his friends had such a public to cater for, and for such entertainments they proposed to substitute their revived Greek tragedy. How were they to proceed? In the first place, they found it impossible to arrange the theatre as the Greeks arranged it—that is, with a large open space between the stage and the spectators, wherein the chorus might perform their evolutions. This had reluctantly to be given up. Likewise had the elaborate scenery on the stage itself to be abandoned—the built-up houses, the verdant grass, the real trees. Most of the pomp and massive pageantry of the Greek drama fell away before the possibilities at the command of this handful of men, so zealous to revive, if not its divine dignity, at least its purity and all its beauty. The masks of the actors were an adventitious adjunct which the Count and his friends never thought of employing. With all this elimination, what, then, was left for the revived Greek tragedy to come and go on? There were the actors; the chorus—now removed from the orchestra, and most reluctantly placed on the stage; the scenery—marvellously robbed of its splendour; and last, not least, the divine dramas left by the Greek poets, whereon to model the structure of the play.

Now, whenever the actors spoke, or rather chanted, in Greek tragedy, the poet made use of a certain metre called iambics, which is very well represented to us by our own iambic measure, such as Shakespeare writes in, with the exception that the Greek iambics were two syllables longer. Its metre was supposed, and correctly supposed, by the Greeks to approximate very nearly to the flow of ordinary prose. This was its especial utility. The actor could chant his speeches in a verse which did not violate any ideas of dramatic probability. The music which went in company with this homely form of verse was itself likewise very free and unmelodious, approaching the cadences of ordinary speech, rather than that exalted form of utterance which we call singing. The actor in reciting his iambics neither sang nor did he speak, but he chanted in a sort of half-musical, half-oratorical tone, being accompanied by occasional chords or notes of the lyre by the chorus, who, stationed beneath the stage, could supply the music to the actor's recitations from the same post of vantage which a modern band now occupy. Count Vernio and his friends were well aware of these various points; but as this peculiar species of musical declamation had never been heard in Italy, they were at a loss to know precisely what it was, or how they could reconcile the ears of their countrymen to accept it.

None of the band of dilettanti was successful in his experiments to reconstruct this defunct style of music, except Giulio Caccini, who, appearing at their assembly one day with a lyre or a violin—we forget which—declaimed with much art many passages of poetry, reproducing in an inimitable way the cadences of the old Greek style, and combining them with the spirit of modern music so successfully as quite to reconcile them to the modern ear. He accompanied himself with the violin or the lyre; but as the lyre of his day was by no means a faithful reproduction of the ancient Greek instrument, being a treble instead of a bass instrument, and as the violin was still less an adequate copy, it was resolved to accompany this style of declamation by the violoncello, called in those days the *viol da gamba*, which gave the bass notes so essential to bring the method of accompaniment in harmony with that of the Greeks. The style of musical declamation invented by Caccini was called *Recitative*, and it was resolved by the assembled company that throughout their tragedy the actors should speak in nothing but the recitative of Caccini. And so far—that is to say, in at least half the framework of their tragedy—they had brought their intended revival into complete harmony with its Greek model.

By placing the chorus on the stage they had put an end to the possibility of the choral dance. The stage was but a few long boards, of only three or four feet deep, and there was barely room for the actors to stand on it. The Greek dramatic traditions were likewise infringed upon, by the necessity of placing a body of instrumentalists in front of the stage, where we have them now, who could be present during the whole continuance of the tragedy, and could at once accompany the chorus in their song and the actors in their recitative. This was an essentially modern innovation, but, as we see, rendered entirely necessary by the peculiar arrangements of the stage on which Count Vernio and his friends had undertaken to produce their tragedy.

Next was the question, How to arrange the music of the chorus? And since the choral odes were at once the sweetest, the most rhythmic, and the most melodious pieces of music ever composed by Greek pen, the revivalists determined to give their composer *carte blanche* to write the chorus in the sweetest music he could compose in the modern style—employing modern harmony and modern melody.

Just as they were about to mould the result of their labours into a solid and artistic form, Count Vernio was summoned from Florence to Rome to take office in the Pope's household as Groom of the Chamber. The friendly reunions which had taken place in his house, and which had been of such untold importance on the development of modern music, were therefore brought to an untimely termination; and the dilettanti might have been deprived of their grand object at the very moment of its fulfilment, had it not been for the enthusiasm of Jacopo Corsi, a wealthy Florentine citizen, who invited them to meet henceforth in his sumptuous dwelling, to continue at their ease their investigations and experiments in musical art. Hither, then, they congregated, and here the finishing touches were put to the great design of launching a new musical art into the

world. The poet Rinuccini, who had been commissioned to write the words, had now brought his labour of love to a conclusion with the approval of the entire coterie; and Jacopo Peri, to whom specially the composition of the music had been entrusted, was likewise far advanced with his task. We do not know why Caccini, the inventor of recitative, was not commissioned to perform the musical part of the task; perhaps he was deficient in the melodic genius necessary to write the chorus; perhaps there was a rivalry between him and Peri, and the latter had succeeded in ousting the original inventor of the recitative style—at anyrate, we hear that Peri had taken up Caccini's invention and had soon come to write it almost as well as its master.

Jacopo Corsi's house possessed large and sumptuous halls, and in one of these a platform was fitted up to serve for the stage, sufficient room was allowed at the wings for the chorus to enter, and doors for the entry of the actors were made at the back. A band of musicians was stationed in the orchestra below the stage, their instruments consisting of a spinet, an organ, three flutes, one violin, four trombones, a horn, and four cornets. A grand *fête* was given by Corsi on the occasion of the performance; the *élite* of Florence flocked to his mansion to hear this extraordinary musical work, about which everybody gave different reports, but which each person seemed to believe would be unique, novel, and interesting. The hall was filled with spectators; the curtain rose; the singers came on the stage; the solitary violin twittered, the cornets too-tooted, the spinet tinkled, the organ boomed, and the first opera ever heard in Europe was brought to a successful performance.

The piece was indeed successful among the chosen and select audience who had assembled to hear it. All people of cultivated tastes also were prepared by their knowledge of Greek culture to receive and sympathise with the efforts of Count Vernio's friends. But the general public were as yet quite uneducated in the style, and purely Philistine. The 'monotonous drawl of the recitative,' as they called it, they could not tolerate. They were firmly convinced that the whole opera from first to last should have been a collection and succession of purely melodious pieces. Antagonism, pasquinade, detraction, did their utmost to discredit the peculiar style of revived Greek music; but 'the Greeks,' as they were now called, still held their own. In a year or two's time, another opera, of more elaborate proportions, entitled *Eurydice*, was ready, Peri and Caccini being its joint composers. Owing to the unfortunate rivalry between these two men, they soon disagreed about the merits of their joint composition, and each resolved to write a *Eurydice* of his own. It was about this time that a great political marriage set all Florence alive with festivity and gaiety. King Henry IV. of France married Mary de' Medici, and the invention of all the caterers of amusement in Florence was taxed to do honour to the occasion. Among other entertainments, the new operas of 'the Greeks' were thought of as likely to add a zest of novelty to the spectacles, and they were duly performed before this enlightened Prince and his young bride. This opened a way for them into France, as the king expressed himself highly delighted

with the novelty of the music. And the other cities of Italy, seeing the good results which attended the Florentine operas, were not long in starting similar performances on their own account. In this way the Opera began to spread; and in fifty years it was established as the most refined and favourite form of music in all the countries of Europe.

BLOOD ROYAL.*

BY GRANT ALLEN,

Author of *In All Shades, This Mortal Coil, &c.*

CHAPTER XII.—TRAGEDY WINS.

MR PLANTAGENET had missed his son by walking through the archway of the Fellows' Quad, instead of through the Brew House. He emerged from the college by the big front gate. The High Street was lighted and crowded; so he preferred to turn down the dark lanes and alleys at the back of Christ Church, till he came out upon St Aldate's and the road to the river. Somewhat sobered as he still was by the unwonted excitement of that curious episode, he found the sherry once more beginning to gain the upper hand; it was hard for him to walk erect and straight along the pavement of St Aldate's, where a few small shops still stood open—for it was Saturday night—and a few people still loitered about in little knots at the corners. With an effort, however, he managed to maintain the perpendicular till he reached Folly Bridge; then he turned in at the wicket that leads down from the main road to the little tow-path along the dark and silent bank of the swollen Isis.

But if Edmund Plantagenet's legs were a trifle unsteady, his heart was all afire with wrath and remorse at this dramatic interlude. For the first time in so many years he began to think bitterly to himself of his wasted opportunities and ruined talents. Such as they were, he had really and truly wasted them; and though perhaps after all they were never much to boast of, time had been when Edmund Plantagenet thought highly indeed of them. Nay, in his heart of hearts, the broken old dancing-master thought highly of them still, in spite of everything, during all those long years: there were nights when he lay awake, sobering, on his hard bed at home, and repeated lovingly to himself the 'Stanzas to Evelina' which he had contributed ages ago to the *Book of Beauty*, or the 'Lines on the Death of Wordsworth' which he printed at the time in the *Yorkshire Magazine*, with a profound conviction that they contained, after all, some of the really most beautiful and least appreciated poetry in the English language. As a rule, Mr Plantagenet was fairly contented with himself and his relics of character: it was society, harsh, unfeeling, stupid society, that he blamed most of all for his misfortunes and failures. Still, to every one of us, there come now and then moments of genuine self-revelation, when the clouds of egotism and perverse misrepresentation, through which we usually behold our own personality in a glorified halo, fade away before the piercing light of truer introspective analysis, forced suddenly upon us by some disillusioning incident or accident of the

* Copyright 1892 in the United States of America by the Cassell Publishing Company.

moment : and then, for one brief flash, we have the misery and agony of really seeing ourselves as others see us. Such days may Heaven keep kindly away from all of us : such a day Edmund Plantagenet had now drearily fallen upon. He wandered wildly down the dark bank toward Ifley lasher, his whole soul within him stirred and upheaved with volcanic energy by the shame and disgrace of that evening's degradation. The less often a man suffers from these bouts of self-humiliation, the more terrible is their outburst when they finally do arrive to him. Edmund Plantagenet, loathing and despising his present self, by contrast with that younger and idealised image which had perhaps never really existed at all, stumbled in darkness and despair along that narrow path, between the flooded river on one side and the fence that enclosed the damp water-meadows on the other, still more than half drunk, and utterly careless where he went or what on earth might happen to him.

The river in parts had overflowed its banks, and the towing-path for some yards together was often under water. But Mr Plantagenet, never pausing, walked, slipped, and staggered through the slush and mud, very treacherous under foot—knowing nothing, heeding nothing, save that the coolness about his ankles seemed to revive him a little and to sober his head as he went floundering through it. By-and-by he reached the Long Bridges, a range of frail planks with wooden side-rails that lead the tow-path across two or three broad stretches of back-water from the Isis. He straggled across somehow, looking down every now and then into the swirling water, where the stars were just reflected in quick flashing eddies, while all the rest about looked black as night, but oh, so cool and inviting to his fevered forehead. So he wandered on, fiercely remorseful within, burning hot without, till he came abreast of a row of old pollard willows, close beside the edge of the little offshoot at Ifley lasher. The bank was damp, but he sat down upon it all the same, and grew half drowsy as he sat with the mingled effects of wine and indignation.

As he sat there, half reclining on the bank, and looking out with bloodshot eyes on the water in front of him, he murmured to himself some inarticulate words of terrible self-condemnation. 'That was a magnificent passage the fellow recited,' he cried—'a magnificent passage ; and it was I who wrote it ; I, Edmund Plantagenet. Did he know it, I wonder, or did he only lie to me ? Was it to shame and disgrace me in my blighted old age ? Well, well, he has succeeded ; he has shamed me at last, whom he thought past shaming. I remember well when I wrote that passage, and many another as fine—ay, as fine and finer. But that's all gone now, and what am I to-day ? A miserable, drunken, old, country dancing-master. It was different then—very different—very different. I was young in those days, and full of hope, and an author, and a gentleman. Yes, in those days, a gentleman. I knew all the best men and women of my time, and they prophesied fair things of me—Mrs Norton, Lady Postlethwaite, even Leigh Hunt and Thackeray. Ah, yes, they would have smiled if I'd told them so in there ; but I remember now as if it were yesterday how Samuel Taylor Coleridge himself took me once by the hand and

laid his honoured palms like a father on my head and gave me his blessing. And finely it's been fulfilled,' he added with a bitter cry—'and finely it's been fulfilled, as they'll see to-morrow.'

He paused a moment ; then he went on aloud once more. 'I've learned something to-night, though,' he continued in a thick voice to himself. 'Those graceless boys, though they never meant it, have taught me something. I thought Edmund Plantagenet's spirit was wholly dead and gone and broken. I know now it isn't, and I thank them for teaching me. I shall go on again now. I know where I'm going to.'

He rose and stumbled on, across a bend of the meadows, till he reached the river. Just there, the bank was very slippery and treacherous. Even a sober man could hardly have kept his footing on it in so dark a night. 'One false step,' Edmund Plantagenet thought to himself with wild despair—and there would be an end of all this fooling. One false step—and splash ! A man may slip any day. No suicide in tumbling into a swollen river, of a moonless night, when the bank's all flooded !'

Still, on and on he walked, having staggered now far, far below Ifley, and away towards the neighbourhood of Sandford lasher. Slippery bank all the distance ; and head growing dizzier and dizzier each moment, with cold and wet, as well as wine and anger.

At last, of a sudden, a dull splash in the river ! Bargemen, come up late in the evening from Abingdon, and laid by now for the night under shelter of the willows on the opposite side, two hundred yards down, heard the noise distinctly. Smoking their pipes on deck, very late, it being a fine evening, one says to the other : 'Sounds precious like a man, Bill !'

Bill, philosophically taking a long pull, answers calm at the end : 'More liker a cow, Tom. None of *our* business, anyhow. Get five bob, mayhap, for bringin' in the body. Hook it up easy enough to-morrow mornin'.'

Next morning, sure enough, a body might be seen entangled among the reeds under the steep mud-bank on the Berkshire shore. Bill, taking it in tow and bringing it up to Oxford, got five shillings from the county for his lucky discovery. At the inquest, thought it wise, however, to omit mentioning the splash heard on deck overnight, or that queer little episode of philosophical conversation.

The coroner's jury, for that end empanelled, attentively considering the circumstances which surrounded the last end of Edmund Plantagenet, late of Chiddingwick, Surrey, had more especially to inquire into the question whether or not deceased, at the time he met with his sudden death, was perfectly sober. Deceased, it seemed, was father of Mr Richard Plantagenet of Durham College, who identified the body. On the night of the accident, the unfortunate gentleman had dined at his own lodgings in Grove Street, and afterwards went round to take a glass of wine at Mr T. M. Faussett's rooms in Durham. Mr Faussett testified that deceased when he left those rooms was perfectly sober. Mr Trevor Gillingham, with the other undergraduates, and the college porter, unanimously bore witness to the same effect. Persons in St Aldate's, who had seen deceased on his way to Folly Bridge, corroborated

this evidence as to sobriety of demeanour. Deceased, though apparently preoccupied, walked as straight as an arrow. On the whole, the coroner considered, all the circumstances seemed to show that Mr Edmund Plantagenet, who was not a man given to early hours, had strolled off for an evening walk by the river bank, to cool himself after dinner, and had slipped and fallen—being a heavy man—owing to the flooded and dangerous state of the tow-path. Jury returned a verdict in accordance with the evidence—Accidental death—with a rider suggesting that the Conservators should widen and extend the tow-path.

But Trevor Gillingham, meeting Faussett in quad after Hall that evening, observed to him confidentially in a very low voice: 'By Jove, old man, we've had a precious narrow squeak of it. I only hope the others will be discreetly silent. We might all have got sent down in a lump together for our parts in this curious little family drama. But all's well that ends well, as the Immortal One has it. Might make a capital scene, don't you know, some day—in one of my future tragedies.'

SOME NOTED AUSTRALIAN NUGGETS.

REFERRING to an interesting article entitled 'Gold in Nature,' appearing in this *Journal* April 19, 1890, and mentioning a nugget of one hundred and thirty-four pounds' weight found in 'South Australia' (Victoria?), perhaps a reference to some noted Australian nuggets and goldfields might be of interest. Chief amongst these nuggets comes the 'Welcome Stranger,' which contained over 2300 ounces of gold, worth about £9200, and was found on February 5, 1869, at Moliagul, near Dunolly, in Victoria. Next in rank comes the 'Welcome' Nugget, found at Bakery Hill, Ballarat, in the same colony, on June 11, 1878, at a depth of about one hundred and eighty feet. This nugget weighed nearly 2200 ounces in the gross, and its net value was £8780. It was sold for £10,000 to a party who wanted it for show purposes, and doubtless cleared thereby the difference in cost.

It would perhaps be a little too much to say that 'nuggets had family ties;' but though they usually 'lie low,' there are at times exceptions to the rule, and when found near the surface, as in the following instances, they are not infrequently in groups. The selections referred to (found in 1870, '71, and '72) are taken from the record of the 'Berlin' goldfield, in Victoria, and do not include the many minor nuggets found in that locality. 'Precious' Nugget, 1717 ounces, value £6868, Catto's Paddock, at a depth of twelve feet. 'Viscount Canterbury' Nugget, 1121 ounces, value £4420, John's Paddock, at a depth of fifteen feet. 'Viscountess Canterbury' Nugget, 896 ounces, value £3536. 'Kum Torr' Nugget, 795 ounces, value £2872, Catto's Paddock, at a depth of twelve feet. 'Needful' Nugget, 249 ounces, value £984, Catto's Paddock, at a depth of twelve feet. 'Crescent' Nugget, 179 ounces,

value £704, John's Paddock, at a depth of two feet. These members of the royal family of nuggets thus totalling nearly 5000 ounces of gold, worth £19,384.

As a rule, however, the richest goldfields are not those where the largest nuggets are found, as witness the well-known Gulgong Goldfield (New South Wales), referred to in Rolf Bolderwood's capital story of *The Miner's Right*. The largest piece of gold found on this field was only sixty-four ounces in weight, and was so thoroughly coated with ferric oxide, that the man who was forking the gravel, &c., out of the sluice-box in which it was found, was going to throw it out, but that its weight attracted him. This goldfield had for fourteen years maintained an average yield worth about £300,000 per annum, the total weight for that time being 1,072,752 ounces (nearly forty tons), valued at £4,162,550. As a great portion of the gold from this locality was found on private property and subject to a heavy royalty, large quantities were sent away through private hands, and thus were not included in the above return. In one part of this goldfield, known as the 'Canadian' lead, the gold—all alluvial deposits—was found in limestone caverns, often in company with the fossil remains of extinct mammoth kangaroos, &c. Some of these caves were over one hundred feet in length by a width of forty feet; but few of them were really bottomed, so as to test the depth, the inrush of water after reaching a certain level being too intense for the machinery on hand.

The auriferous district of which Gulgong is a part extends in a southerly direction for about one hundred miles, having a varying width of from thirty to ninety miles. It was in the Hargraves or Sofala branch of this great field that the famous nugget mentioned by Charles Reade in *Never too Late to Mend* was found; and subsequently other handsome nuggets were unearthed, including one at 'Maitland Bar,' weighing 344 ounces, and worth £1240. The former of these two nuggets was really found by a black-fellow, as described by Mr Reade, and contained about 1200 ounces of gold, worth £4500.

Between Hargraves and Bathurst lies the celebrated goldfield of Hill End, a reefing district adjoining the alluvial field of Tamaroora, which had previously been worked for many years. Hill End was chiefly noticeable for the richness of the narrow 'leaders'—quartz in slate and diorite—which were found in the sloping face of a very precipitous hill descending to the Turon River at its foot. Some of these claims were certainly wonderfully rich, especially considering their limited extent, few of them being over one hundred and twenty feet along the line of reef, if reef it could be called, it being so irregular in form. Notwithstanding their small size, these claims were eagerly bought up at one thousand pounds per foot along the supposed

or real line of reef; and yet, in spite of this and the enormous cost of sinking shafts—twelve pounds per foot—some of them paid extraordinary dividends. 'Krohmann's' claim, floated for £120,000, returned over £200,000 net to its shareholders; and 'Beyers and Holtermann's' claim did nearly as well as this. Carroll and Beard's, the next *en suite*, though yielding some rich crushings, came rather short of paying cent. per cent.

One enormous slab of slate, and quartz, and gold, all intermixed—from Beyers and Holtermann's claim—weighing about three hundred-weight in all—yielded fully 1200 ounces (one hundredweight) of gold, the whole of the crushing, which included this, being worth about £60,000, and averaging about five hundred ounces to the ton. A similar quantity of stone from Carroll and Beard's claim, crushed at the same time, returned about 12,000 ounces of gold, worth £48,000.

In the claims succeeding those just mentioned, the gold was not found at a depth but principally in 'pockets'—to use a Californian term—some of these pockets being very near the surface of the ground. The discovery of the treasures of the Hill were indeed brought about through the accidental finding of one of these pockets by a man who was returning from an unsuccessful search for some of his cows, who had wandered down the steep hillside towards the better pasturage contained in some of the gulleys at its foot. Of course, as soon as it was discovered that the lower claims did not contain gold at a depth, a terrible shrinkage in value soon ensued, and hundreds, even thousands, of unfortunate men and women who had invested their savings in these claims in the hope of their turning out as rich as Krohmann's had been, were irretrievably ruined.

The goldfields of Temora, Grenfell, Lambing Flat, Snowy River, Araluen, &c., yielded each in turn large quantities of gold; but none of them were noted for producing individual pieces of large size, though some respectable nuggets of from sixty to six hundred ounces in weight were found at 'Little River,' in the Braidwood district.

Queensland has some splendid goldfields, which for general productiveness have hardly been surpassed. These include Gympie, Croydon, Charters Towers, and the famed Mount Morgan mine, which latter property was once valued by the public at £15,000,000; its present market value is about £1,500,000. Prior to the introduction of the chlorination process, only about half the gold contained in the stone was saved, and the whole claim could have been purchased for a very much smaller sum.

The fields last mentioned, though maintaining handsome yields per ton upon the average, do not properly come within the range of an article dealing with rich specimens, which, as has been premised, are occasionally found on some of the poorest fields. As a rule, the yield from the

Queensland reefing fields above mentioned has been much more reliable than is the case in other colonies, though Victoria has some good reefs still in work.

RALPH THORNLEIGH'S PICTURE.

By E. D. CUMING.

IN FOUR CHAPTERS.—CHAP. I.

'SHE refused you!' exclaimed Miss Elizabeth Macallan, throwing up her hands in astonishment.

'She refused me,' assented Colonel Stardale with grave composure.

'Well, if the sky had fallen, it would not have surprised me more,' declared Miss Macallan. 'What does the girl mean?'

Colonel Stardale shook his head slightly, but made no verbal reply. If the truth must be told, the collapse of the firmament was to his mind an hour ago an event more possible than his rejection by Miss Beatrice Cairnswood.

Fortune had dealt so kindly with the Colonel that he might be pardoned for entertaining a high opinion of himself. The world in which he moved like a social constellation had taught him to believe that his will might ever be his way; that, above all, he might marry any woman he chose to honour with his preference; and Colonel Stardale had learned his lesson. But until to-day he had never himself initiated a movement in a matrimonial direction; and now, when for the first time he had offered his hand and heart, they had been declined. Gratefully, almost affectionately, but positively declined; and the Colonel was stunned.

'She must be mad,' said Miss Macallan with conviction—'mad!'

'She was very decided in her refusal,' sighed Colonel Stardale as he stirred his tea—'very decided. But I am unwilling to believe that I have received her final answer. Perhaps I—ah—took her by surprise.'

Miss Macallan could not trust herself to reply; she sat nervously fingering the sugar-tongs, now and again stealing a half-fearful glance at her companion, who remained silently gazing at his patent leather boots, while he wondered whether the events of the last half-hour had been a dream.

Colonel Stardale was a handsome, soldierly-looking man of two or three and forty; his youthful athletic figure was the admiration of Park and Clubland alike. His dress was as nearly perfect as human tailor could make it, and almost painfully neat; no one had ever seen the Colonel with an unbrushed hat or a speck of mud on his white gaiters; and he bore himself with a self-possessed grace which nothing had ever been known to ruffle. He had retired some years ago from the 50th Hussars to devote himself to the affairs of his estate in Wiltshire, and to shed the halo of his presence upon Society: and—he had eighteen thousand a year.

For some months past his attentions to Miss Macallan's niece, Beatrice Cairnswood, had furnished the afternoon tea-tables of his many friends with a favourite topic of conversation;

and latterly they had been sufficiently marked to justify ladies of an inquiring turn of mind in asking Miss Macallan whether there was really 'anything' between her niece and the Colonel.' To which questions that excellent woman would protest absolute ignorance; but in accents which were intended to, and did, lead people to believe they might expect to hear something ere long. And now, when every one was worked up to a feverish pitch of expectancy, the Colonel had proposed; and Beatrice had rejected him!

While her aunt makes spasmodic and unheeded efforts to console the disappointed suitor, we may leave the drawing-room and go in search of Miss Cairnswood.

We find her lying back in a deep armchair in the library where Colonel Stardale left her. She is a little girl, whose face is framed with tangles of unruly brown hair. Now the face is in repose, it is almost insignificant; you might pass it a dozen times in the street and scarcely notice it; but when the eyes light up with animation the change is wonderful, and you marvel no longer that men should rave about Beatrice Cairnswood's beauty. She is only twenty, and Colonel Stardale is the fourth admirer who has 'come to the point,' but no one, not even a woman, has ever called her a flirt. She is an orphan, absolutely dependent upon her uncle, Mr Angus Macallan, who, with his sister Elizabeth and herself, comprise the household at No. 65 Warriston Square, South Kensington. She has no money beyond the 'dress allowance' given her by her uncle, and no expectations; for there is a young Mr Macallan out in China who is to inherit whatever his father may have to leave.

She looks very grave and preoccupied as she sits looking dreamily into the fire. Colonel Stardale was quite mistaken when he told Miss Macallan that he might have taken her by surprise when he proposed this afternoon. Beatrice had been prepared for his declaration, and had done her utmost to stave it off, hoping he would understand her; and twice she had succeeded in postponing the evil day. But the Colonel could not or would not believe she was indifferent to him, and insisted in rushing upon his fate. The interview had lasted but three minutes, for her refusal had so astounded the gentleman that he could only preserve his customary calm by beating a hasty retreat.

Could she bring herself to look upon him as—ah—something more than a friend? he had asked her. Beatrice, somewhat vehemently, would be glad if he would always allow her to regard him as a friend, but— The Colonel begged pardon, but perhaps he had not made his—meaning clear; he sought for the honour of her hand, to—ah—make her his wife, in fact. Beatrice, fidgeting nervously and turning red and white by turns, was sorry—very sorry—because she had always liked him so much; but she couldn't marry him.—Couldn't marry him? Oh no!—She really did not know what to say or how to thank him; but he must not ask her again, for she couldn't possibly marry him.—Might the Colonel presume so far as to ask—ah—why not?—Beatrice knew how ungrateful she must seem, but, but— Well, the truth was, she didn't like him well enough. This was the admission which took her suitor's breath away; and Miss Cairnswood had

scarcely realised what had passed by the time Colonel Stardale had reached the drawing-room and announced his rejection to Miss Macallan.

Half an hour later, the shutting of the hall door told her that the Colonel had taken his departure; and the rustle of her aunt's dress on the stairs warned her to make ready for an interview which would not be much pleasanter than the last. Colonel Stardale's excellences and income had been dangled before her eyes with untiring perseverance ever since she made that gentleman's acquaintance, and she had a very fair idea of what was before her. A moment more, and the elder lady sailed into the library and took a chair opposite her niece.

'Well, Beatrice?' she began questioningly, as though she had responded to a summons at grave personal inconvenience. 'Well?'

As her aunt did not seem inclined to open the ball, and Miss Cairnswood knew by bitter experience that the longer she was allowed to nurse her ire the more violent would be its ultimate explosion, she judiciously gave her an opening.

'I suppose Colonel Stardale has told you?' she said.

'Colonel Stardale has told me of your extraordinary conduct. I am utterly at a loss to comprehend it myself, and thought you might feel that some explanation was due,' said Miss Macallan, folding her hands in her lap and sitting very stiffly upright.

'I don't like him well enough,' said Beatrice, to whose mind this reason was quite conclusive.

'Don't like him well enough!' echoed her aunt. 'Have you forgotten what his position is? Have you forgotten that he has eighteen thousand pounds a year?'

It had been passing strange if the amount of the Colonel's income had escaped Beatrice's memory: the figures had been dinned into her ears almost hourly for the last six months.

'But I can't marry a man I don't care for,' argued Beatrice, plaintively. 'Could you, auntie?'

'No one wants you to do so,' retorted Miss Macallan, rather illogically. 'But when you go and refuse a man, for a chance of marrying whom half the girls in England would give their ears—when you actually throw away— Upon my word,' she broke off angrily, 'I don't know what you expect.'

Beatrice sighed deeply, and resigned herself to listen, for she saw her aunt had much to say yet.

'I can't understand you,' went on Miss Macallan. 'When Mr Cooper proposed and you declined him, I said little, because I knew there was Captain Geoffreys. When you refused Captain Geoffreys, I felt confident you would not have done so had Sir Barnaby Phipps not been paying you so much attention. I own I was disappointed when you gave Sir Barnaby his congé, because then the Colonel had only seen you two or three times, and of course I never anticipated that he would take a fancy to you.—What does it all mean?' almost wailed the old lady. 'Is there any one else coming on?'

'There's no one else coming on, as you express it,' replied Beatrice shortly. It gave her no pleasure to hear her conquests thus told off on her aunt's fingers. She looked upon Mr Cooper and

the others as so many friends lost, and had no ambition to add more to the list.

'Why don't you like Colonel Stardale?' cried Miss Macallan, goaded to desperation by her niece's calmness. 'He's a very handsome man; he's certain to get the seat for Chalksbury at the next election; and, as I've often, often told you, he's got eighteen'—

'Oh, don't tell me that again, Aunt Elizabeth.'

'Such folly; such—such'— But at this point Miss Macallan's voice failed; she dissolved in tears and left the room.

'I am glad that's over,' said Beatrice to herself as the door closed behind her aunt. 'I really think I'd better explain everything to Uncle Angus. I daresay he will be angry; but I think I can manage him. I wish he would be quick and come in.'

As though in answer to her wish, the hoarse cough she knew so well proclaimed that Mr Macallan had just come in from the City, and was taking off his coat in the hall. Beatrice went to the library door and called him.

'Uncle, come here for a minute; I want you.'

If Mr Angus Macallan was master of the house, Miss Cairnswood was mistress of the master. Her lightest word was law to the old gentleman, and she might have led him a terrible life had she pleased. He followed her into the room, rubbing his hands briskly before he took her head between them and bestowed his usual kiss.

'What is it, Bee?' he inquired, taking the chair she had just vacated.

'Colonel Stardale was here to-day, uncle.'

There was a long pause.

'I suppose you are going to tell me that he proposed to you?' said Mr Macallan at length.

'Yes, uncle.'

'Hum!' Miss Cairnswood had never discussed her last suitor with her uncle, and, influenced by his sister's views, that gentleman thought it quite probable that Beatrice had at last found some one to her mind. But previous occurrences of a like nature rose to his thoughts, and he had his doubts. He therefore tapped his finger-tips together and looked at his niece with an inviting smile.

'And I refused him,' said Beatrice, slowly.

Mr Macallan pursed up his lips, and his smile faded. Beatrice sat waiting for him to speak, and uncle and niece stared at each other for two minutes in silence.

'Does your aunt know?'

'Yes. I'm afraid she's dreadfully disappointed.'

'It is a pity you don't care for him,' remarked Mr Macallan; 'but I would not have you marry any man, however good his position, unless you really liked him.'

Beatrice slipped from her chair and came over to her uncle's side, blushing hotly.

'What's the matter, Bee?' asked the old man, putting his arm round her.

'I must tell you, uncle,' answered Beatrice in a quavering voice. 'I like somebody else. And he hasn't any money; so we can't marry. And I won't marry anybody else. There!'

It was a short but comprehensive story. Mr Macallan, however, had suspected the existence

of some secret of this kind, and his niece's confession was not altogether a surprise. He drew her on to his knee, and petted her hand for a few minutes until she recovered her composure.

'Tell me all about him, my dear. What is he? Could I help him at all?'

Beatrice shook her head.

'I'm afraid not, uncle. You see, he's an artist; he paints most beautifully, but somehow he can't sell his pictures. And he is so dreadfully hard up that he doesn't like to go out in the daytime in his shabby clothes.' And with this, Beatrice completely broke down.

Mr Macallan drew her head down upon his shoulder and soothed her, looking very grave the while. This was indeed an unlucky attachment; an artist who could not sell his pictures, and wore clothes which would not bear the light of day! It was about as bad a business as could be, and he felt that he must not encourage Beatrice by receiving further confidences. Had the 'somebody else' been a steady young man in the City, now, Messrs Macallan & Son might have been able to put something in his way; might have found him some appointment whose emoluments would enable him to marry. But an artist; and one who couldn't sell his pictures! Mr Macallan felt the spring of sympathy cooling in his breast, and he released Beatrice without asking any more questions. He could not let her go without a word of reassurance, however; though, as he spoke, he knew it was not particularly inspiring.

'Well, Bee, if you can't marry the man you do like, I'll never press you to marry one you don't like. Be sure of that.' He put her down, and went up-stairs to find his sister. He knew that Miss Macallan had set her heart upon this brilliant match for their niece, and as a matter of fact, was himself more disappointed than he cared to show. He was keenly anxious to see Beatrice happily settled, though the house would be sadly dull when she left it; but his motives for desiring it differed widely from those which actuated his sister.

Mr Macallan was by no means the wealthy man he was popularly supposed: the China trade was passing through an era of depression which had obliged many old City houses to close their doors during the last few years. Messrs Macallan had weathered the storm so far, but it had tried them sorely, and men behind the scenes said the banks were beginning to look shyly at the firm. It might pull through if things in the East soon took a turn for the better; but if they did not— The knowing ones shook their heads, and spoke in undertones of 'poor old Angus.'

Mr Macallan never mentioned business matters at home; but latterly his sister and niece had noticed the weary air he wore when he came in from the office in the evening. Last year, when the snug little dinners which had been a bi-weekly institution were given up, Miss Macallan thought it a pity her brother should lose his taste for society just when Beatrice had 'come out;' but she never imagined there was any reason for it beyond that he gave—he was not so young as he used to be, and preferred quiet evenings. Then the butler and two or three servants had been dismissed, and the stable

department reduced. It then became apparent to Miss Macallan that retrenchment was the order of the day; but neither she nor Beatrice was called upon to exercise any little economies, and they had no suspicion of the gaunt skeleton in the cupboard which was growing month by month more impatient to show himself. They lived more quietly, but gave up no comfort or luxury to which they had been accustomed, and there was nothing to suggest that money was growing scarcer day by day.

Mr Macallan found his sister in the drawing-room brooding over a novel in a state of moist depression. She, like Colonel Stardale, was asking herself, 'What will people say?' and was answering the large question with the words conviction forced upon her—namely, that Beatrice would never have such a chance again—never.

'Have you seen that wretched girl?' she asked gloomily, as her brother came in.

'Yes; I know all about it.'

'What are we to do with her?' asked Miss Macallan, rocking herself to and fro, while she felt for her pocket-handkerchief.

'She must go her own way in these matters,' replied Angus, poking up the fire; 'but it would have been a great weight off my mind had she accepted the Colonel.'

'She is a dreadful responsibility,' groaned Miss Macallan. 'An awful responsibility.'

'And is likely to become a much heavier one,' added Angus, 'when she is cut off from society.'

'What do you mean?' asked his sister, alarmed by the earnestness of his tone.

'I mean this,' said the old gentleman, turning in his seat to look her straight in the face.—'I mean that we can't go on living in our present style. I can't afford it; and it is only fair to tell you that certain contingencies may arise within the next few months which will oblige me to make a radical change: I shall have to sell off the house, furniture, and all I have.'

'Angus!' exclaimed Miss Macallan, turning pale.

'It is best you should know the truth, Elizabeth. Things may pull round, but I haven't much hope of it. That is why I am anxious to see Beatrice safely housed in a home of her own.'

'What are the contingencies you spoke of?' inquired Miss Macallan.

'It would answer no purpose to explain them precisely. But I may tell you that we are hanging by our last rope: the sale or mortgage of certain property in the East.'

'You mean that the firm will fail if you can't realise the value of the property by a given date?'

'That's it, exactly,' replied Angus with deliberation. He had for so long been staring ruin in the face that he was becoming callous about himself; but he quailed before the thought of his sister, his numerous dependents, and, above all, of Beatrice reduced to penury. His failure would blight her life in all reasonable likelihood. What would she do in a remote London suburb or French country-town, whichever he might select as hiding-place for his fallen grandeur?

'Have you told Beatrice all you have told me?' asked Miss Macallan after a long silence.

'No. I couldn't bring myself to do it after I had heard her story.'

'What story?' asked the old lady, scenting revelations.

'She has fallen in love with a penniless artist. I don't know his name or anything about him, except that he is penniless. And Bee declares she will never marry any one else.'

'Ah!' said Miss Macallan. It is a very inexpressive word on paper; but Elizabeth Macallan's 'Ah!' conveyed whole volumes. Her brother moved uneasily as he heard it, and tried to repair the mischief the monosyllable told him he had done.

'She is very sensible about it,' he said—'acknowledges that she can't marry the man, and doesn't go in for romance or sentimentality about him.'

'I knew there must be something at the bottom of it all,' said Miss Macallan quite cheerfully. Some people derive their purest pleasure from being right at their own expense.

'Don't say anything about it to her,' said Angus; 'it would do no good, and only distress her.' (Miss Macallan emitted a snort of contempt.) 'He never goes anywhere, and they never meet. The affair will die a natural death if we ignore it.'

The lady made a gesture of acquiescence, but privately resolved to learn all Beatrice could tell her about the penniless artist before she went to bed that night. If Angus Macallan had known the sex a little better, he would have acknowledged the unwisdom of confiding so tempting a secret to his sister with instructions to keep silence.

Accordingly, when Beatrice had retired to her room, her affectionate relative pursued her thither, and without much difficulty cajoled her into telling everything relative to her lover.

His name, it appeared, was Ralph Thornleigh; he was the son of a country gentleman, and had come with a little money and some good introductions to seek his fortune in London. He had spent the former gaily, never doubting that his talents would soon be recognised and place him far above the reach of want. Beatrice met him for the first time at a ball; they danced together; went down to supper together; sat out together; danced together again, and sat out a little more. Thereafter, they met ten or a dozen times at parties of various kinds, and in due time discovered that they had been born for one another. He told Beatrice he was not in a position to ask her for any promise, but had every reason to believe he should be soon. She, being perfectly certain in her own mind that his success was merely a matter of months, if not weeks, told him she would wait.

Then there was no actual engagement?—No-o; it couldn't be called an engagement, because Ralph hadn't given her a ring; but there was an understanding. It was true that since he had run through his money, he had been going steadily down hill, and was never seen anywhere; but that didn't make any difference: she had promised to wait for him, and would wait.—How long?—Well, for Ralph's own sake Beatrice hoped it would not be long before people began to buy his pictures; but really she didn't know.—And did Beatrice mean to say that she had

refused Mr Cooper, Captain Geoffreys, Sir Barnaby Phipps, and of all men in the world, Colonel Stardale, all on account of this artist person?—Yes; that was what Beatrice meant; not that she would have accepted any one of them, even if Ralph had not existed, for she did not care for them. She couldn't love any one but Ralph Thornleigh; would marry him if she had to wait till she was forty.—Indeed! And where did she propose to wait?—With Uncle Angus, if he would keep her.—Oh! Then Beatrice had better review her determination very seriously for a day or two. If she was in the same mind about waiting, say by Sunday, Aunt Elizabeth would have something to tell her which might cause her to think differently.

THE RECREATIONS OF EMINENT MEN.

RECREATION is as necessary in the economy of life as work. There is profound philosophy in the nursery lines about all work and no play. Health of body and vigour of mind are essential to the full enjoyment of life; and recreation, amusement, diversion, is a really important factor in the promotion of this desirable condition. It stimulates the imagination, and lifts us out of the ruts along which the routine of our ordinary life forces us to travel. Voltaire, indeed, went so far as to say that 'amusement is the first necessity of civilised man.' On the other hand, a great living French critic represents 'amusement as a comfortable deceit by which we avoid a permanent *tête-à-tête* with realities that are too heavy for us.' We agree with neither dictum. Why should we put amusement into competition with the realities of life? It is simply a relaxation from those realities, and in that respect is, as Voltaire says, a necessity, though not 'the first necessity of civilised man.' We can't afford to part with any advantage. We learn by laughter as well as by tears, we grow strong by rest as well as by work. The breeze playing round the temples is as necessary to the vigour of the mind as a dose of metaphysics or a chapter of Plato. Dean Swift's favourite maxim was, 'Vive la bagatelle!' He thought trifles a necessary part of life, and perhaps found them necessary to himself.

Mr Gladstone's recreations take the form of writing pamphlets on theological controversy, or felling trees; and no professed wood-cutter is more expert in laying prostrate a mighty oak than the right honourable gentleman. Chemistry engrosses the leisure moments of his political opponent, Lord Salisbury. Carteret, another English statesman, when driven from office, 'retired laughing,' says Macaulay, 'to his books and his bottle.' Fox found relief from political work in his loved Greek authors, as did the late Lord Derby, the Rupert of debate. Talleyrand in the intervals of ministerial work played whist. Peirese, a French antiquary, found his amusement amongst his medals and intaglios; the Abbé de Maroles with his prints, of which he collected about one hundred thousand, which are now in the National Museum of Paris. Rohault,

a Cartesian philosopher of the seventeenth century, wandered from shop to shop to observe the mechanics labour. Goldsmith tells us of a famous painter whose whole delight, during his confinement in prison for debt, consisted in drawing the faces of his creditors in caricature. King Louis XIII. of France spent much of his time in catching small birds or making *jets-d'eau* with quills.

It is said of George Herbert that 'the one delight of his life in the way of recreation was music, setting and singing his own hymns and anthems to viol and lute.' Many learned men have found recreation in the same way. A byework of this kind always provides a delightful rest or change. Bishop Warburton confessed that music was always a necessity to him when engaged in intellectual labour. Addison says: 'A man that has a taste for music, painting, or architecture, is like one that has another sense when compared with such as have no relish of these arts.' Milton loved music, and used to play upon an organ. Carlyle tells us that 'the main recreations' of Frederick the Great 'were music and the converse of well-informed friendly men'—two things of which, we may remark, George Eliot was also passionately fond. Dr Johnson, it would seem, had no sympathy with those who thus amused themselves. A lady after performing with the most brilliant execution a sonata on the pianoforte in the presence of the great Doctor, turning to him, took the liberty of asking him if he was fond of music. 'No, madam,' replied the philosopher; 'but of all noises, I think music is the least disagreeable.' He would agree with the poet who says:

Heard melodies are sweet, but those unheard are
sweeter.

The favourite recreation of Pope's leisure hours was the society of painters. Nothing was more agreeable to the poet than to spend an occasional evening with his friend Kneller, who, to use the words of Thackeray, 'bragged more, spelt worse, and painted better, than any artist of his day.' Warburton tells an amusing anecdote of the two friends. Mr Pope was with Sir Godfrey Kneller one day when his nephew, a Guinea trader, came in. 'Nephew,' said Sir Godfrey, 'you have the honour of seeing the two greatest men in the world.' 'I don't know how great you may be,' said the Guinea man, 'but I don't like your looks. I have often bought a man much better than both of you together, all muscles and bones, for ten guineas.'

Another great painter, Sir Joshua Reynolds, used to amuse himself in his last days in his house in Leicester Square with a little tame bird, which, like the favourite spider of the prisoner in the Bastille, often served to while away a lonely hour. But this proved a fleeting pleasure, for one summer morning, the window of the chamber being by accident left open, the little favourite took flight, and was irrecoverably lost, although its master wandered for hours in the square and neighbourhood in the fruitless endeavour to regain it.

The favourite recreations of the late Field-marshal Count Von Moltke were chess and whist, which he rarely missed playing after dinner. The Count was an authority on the culture of

roses; and at Kreisau, where he spent most of his time after his retirement from active service, he possessed one of the finest and most unique collections of roses in Germany.

Sir William Temple relaxed his mind from the affairs of state by clipping his apricots or cultivating his tulips. Gardening was an exercise in which he much indulged. An epicurean himself, he says in his famous *Essay on Gardens*: 'Epicurus passed his life wholly in his garden. There he studied, there he exercised, there he taught his philosophy; and indeed,' he goes on to say, 'no other sort of abode seems to contribute so much to both the tranquillity of mind and indolence of body which he made his chief ends.' Other great men, as well as Epicurus and his disciple, Sir William, have loved gardening without, however, finding it to contribute to that bodily indolence of which the philosopher speaks. What a sturdy specimen of manhood was Martin Luther, for example, and yet gardening was a favourite amusement with him. Writing to a friend to procure him some seeds, he says: 'While Satan rages, I will laugh at him, and enjoy my Creator in the garden.' An ingenious writer has observed that 'a garden just accommodates itself to the perambulations of a scholar, who would perhaps rather wish his walks abridged than extended.'

In Pope's letters there is a characteristic account of the mode in which men of learning take exercise. 'I, like a poor squirrel, am continually in motion indeed, but it is about a cage of three foot; my little excursions are like those of a shopkeeper who walks every day a mile or two before his own door, but minds his business all the while.' Archbishop Whately was seen to most advantage at Redesdale, his country-seat near Dublin, gardening, tree-cutting, grafting, and romping with his children and dogs. With him, as with many eminent men, Bismarck, Sir Walter Scott, Hogarth, Rubens, Henry Irving, and others, dogs were great favourites. One especially, which he possessed at Oxford, was noted for his climbing performances; and it was the great delight of Dr Whately to exhibit his feats in Christ Church meadow. On the very morning on which he had received the letter of Lord Grey offering him the see of Dublin, a visitor who was a stranger to him was asked out to see the feats of his climbing dog. The animal performed as usual; and when he had reached his highest point of ascent, and was beginning his yell of wailing, Whately turned to the stranger and said: 'What do you think of that?' 'I think that some besides the dog, when they find themselves at the top of the tree, would give the world they could get down again.' A striking remark just then for one who was not aware of the offer Whately had just received.

Another great prelate, Bishop Thirlwall, amused himself in the same way. When the mind was jaded over one of his elaborate charges, or some abstruse philological problem, he used to take a stroll in his garden at Abergwili, book in hand, or surrounded with his domestic pets. We all know how the poet Cowper cheered his melancholy hours many a time with the gambols of his pet hares, 'Tiny, Puss, and Bess.'

While Kepler worked out the secret of the heavenly bodies, 'going over his calculations sixty

times,' he now and then turned aside to write almanacs for his daily bread. So the weary worker took his recreation. Addition in his later years used to retire to the picture-gallery of Holland House, called afterwards the Long Room. There he sought repose and the solace of strong waters. The tradition is that he placed a bottle and a glass at each end of it, and so alternately exercised his lips and his legs. Now and then, by way of a change, he would stroll down to a coffee-house at Kensington to drink his solitary glass, and thus endeavour to forget awhile public business and domestic troubles. It used to be a pet amusement with Molière, the French dramatist, to ensconce himself in the corner of a barber's shop and there silently watch the air, gestures, and grimaces of the village politicians, who in those days, before coffee-houses were introduced into France, used to congregate in this place of resort. The fruits of this study may be easily discerned in those original sketches of character, from the middle and lower classes, with which his pieces everywhere abound, and which made his plays so popular amongst his countrymen. 'Courage, Molière,' cried an old man from the pit; 'this is genuine comedy.' And the success of the poet vindicated the critical wisdom of the old man.

The only relaxation Kant, the celebrated German philosopher, allowed himself was a walk which he invariably took during his life at Königsberg at about the same hour every afternoon. His usual stroll was along the banks of the Pregel towards the Friedrich's Fort; and in these walks he was always a careful observer of the phenomena of Nature. He told his friends one day how, as he passed a certain building in his daily walk, he had noticed several young swallows lying dead upon the ground. On looking up, he discovered, as he fancied, that the old birds were actually throwing their young ones out of the nests. It was a season remarkable for the scarcity of insects, and the birds were apparently sacrificing some of their progeny to save the rest. 'At this,' added Kant, 'my intellect was hushed; the only thing to do here was to fall down and worship.' Another great philosopher, Bishop Butler, used to take his recreation, according to one of his chaplains, in a somewhat singular manner: he would walk for hours in the little garden behind his palace at Bristol 'in the darkest night which the time of the year could afford.'

It may be mentioned that some learned men have found amusement in composing works on odd subjects. Seneca wrote a burlesque narrative of Claudian's death; Pierius Valerianus wrote a eulogium on beards; and a French author has in modern times composed with due gravity and pleasantry a learned treatise, entitled *Éloge de Perruques* (A Eulogium on Wigs). Gaspar Talia-cotius, of whose feats of surgical skill Butler in his *Hudibras* gives an amusing account, wrote a treatise in Latin called *Chirurgia Nota*, in which he teaches the art of ingrafting noses, ears, lips, and other members of the human body with proper instruments and bandages—a book which has passed through two editions. Dr Johnson somewhere observes that it seems to have been in all ages the pride of art to show how it could exalt the low and amplify the little. To this

ambition perhaps we owe the frogs of Homer, the bees of Virgil, the butterfly of Spenser, the quincunx of Sir Thomas Browne, and the 'little celandine' of Wordsworth.

A GRIFFIN AND HIS SERVANTS.

THE ways of a Griffin are hard: his fellow-countrymen hoax him; whilst the dusky sons of the soil plunder him. The latter do this more or less during the whole of his sojourn in India, but not to the same extent as they do it while in his griffinage. For that period he is as a sheep in the hands of the shearers, and shearers too who are not particular as to what depth they cut in removing the fleece. But never yet was callow Englishman in the hands of the Philistines as early in his career in India as I was; for before the ship that bore me to that sultry clime hove to off Garden Reach, Calcutta, a Madrassé 'boy' of some thirty summers appeared on deck and appropriated me to his service. His name was Ramma Sawmy. Where he came from, to this day I cannot tell; but there he was before—it appeared to me—the steamer had stopped. He looked round, spotted me, a palpable griffin, and making a salaam, asked if 'Master' wanted coolies to take his baggage on shore. I certainly did; and before I had time to make terms for their services, my trunks were on the top of a gharry and I was inside. Ramma Sawmy got on the box, and away we drove to the *Auckland Hotel*. I had intended going to another (Spence's); but Ramma Sawmy thought differently, informing me 'many gentlemen go there, no much room.' On this point I have no cause to find fault with him, for I liked the *Auckland*, and could not have done better; but that was not the point—it simply showed what a master mind Ramma Sawmy had. He evidently was completely at home at the *Auckland*, and I was at his mercy there. He spoke to the manager about my room, saw my luggage safely deposited therein, paid the coolies, and then said he should like to enter my service.

Being at an hotel, I did not quite see what I should want with a servant; but Ramma Sawmy told me 'all gentlemen keep servant,' if only for the look of the thing. Besides, I was inexperienced in the ways of punkah coolies and other necessities of life in India; these it would be his business to look after for me, otherwise my life would be a burden in such an enervating climate. I succumbed; and Ramma Sawmy was engaged there and then at twenty rupees a month—twelve or fourteen would have been ample—to be my servitor as long as I remained in Calcutta; with a proviso, that if he suited, he would go up country with me when my destination was decided upon.

Once engaged, my domestic entered on his duties with great promptitude; he put my things in order; sorted out my dirty linen, the accumulations of the voyage, made a list of it, as he intended bringing a man for it in the morning, and then suggested I should take a drive on the Mall.

But by this time I was beginning to wonder if it would be judicious to leave Ramma Sawmy in possession of my property, and thought of the Latin proverb which asks, 'Who shall guard the

guards themselves?'—so suggested the propriety of Ramma Sawmy giving me references. This was too much for him. He felt hurt—I could see it by the twitching of his mouth as he said he would in the morning bring documentary evidence of his goodness so overwhelming, that I might consider myself lucky in having secured the services of such a paragon. He spoke with so much emotion, I believed him, and took my first drive in Calcutta, happy in my mind at the thought of being able to leave my belongings in the care of such a guardian.

Early the next morning he was by my bedside with coffee and a biscuit; these I demolished whilst he arranged my clothes, then he placed his testimonials in my hand. I read them once, I read them twice, and think I should have read them a third time, had I not looked up and seen Ramma Sawmy standing with bowed head, the picture of silent reproof. Tears came as I grasped his hand, for was he not a Mutiny hero; had he not saved the lives of a certain lady and her children; had he not been a good and faithful servant to sundry generals, colonels, and commissioners; and I had ventured to doubt, for one short moment, such a man! 'But never again, Ramma Sawmy! Only serve me as you have served your king—as a great cardinal once observed—and so long as my salary is duly paid, so long shall you receive a portion of it.'

Confidence being established between us, Sawmy suggested going to the bazaar to purchase blacking and sundry little articles of daily use. To do this he wanted rupees, which were to be accounted for in due course; but these, as well as many more rupees, were not altogether satisfactorily accounted for; though perhaps I was not a competent judge of the value of the things bought. He also assisted me in purchasing several articles of intricate workmanship in the China bazaar, presents for home. Besides this, he helped me greatly in beating down the numerous 'box wallahs' who came in swarms to my room with articles for sale.

It was wonderful what a number of things I found necessary, or was persuaded were so, whilst staying in Calcutta; I therefore welcomed the order I received one morning to go to Allahabad and report myself to an official there. It was now I found out the real value of my treasure; he packed my things, sent the heavy baggage off by steamer, told me what we should want on the journey, and laid in stores for it. He depicted the meagre fare we should obtain *en route*—the chances of a breakdown, and consequent privation if not amply supplied with tinned provisions. I therefore left him with a free hand, whilst I devoted my last few hours to home letters.

In the one to my mother I told her of the dusky treasure I had secured; begged her to increase her subscription to the S.P.V.—a Society profanely called by a friend one for the propagation of vice in foreign parts—and finally assured her that her parting advice to be kind and patient to the mild Hindu should be carefully carried out.

My letters posted, presents packed and made over to my agents for despatch, I had not a care as we crossed the Hooghly to get to the railway station at Howrah, where we commenced our journey to the North-western Provinces. I took

our tickets to Raneegunge, giving Ramma Sawmy his, whilst I chummed with a doctor and two young officers bound for Patna.

Arrived at Raneegunge, the extent of our railway journey, I looked for Ramma Sawmy amongst the native passengers, but could not see him, for, like the vulgar boy of Ingoldsby, 'he was not there;' and to quote Ingoldsby again, slightly altered—'never to this hour have I beheld that native boy.'

I should like to pause now and express my feelings in red ink, but dare not, so will describe Raneegunge instead. It will be more soothing, for it will give me no trouble. In fact, the railway station and an hotel comprised the place as far as I saw it. The first I had done with when Ramma Sawmy could not be found there; the latter I stayed at for an hour or two, simply to get my dinner. It was a barn-like edifice, cheerless and unhome-like, whilst the food was high, so was the price of it. Perhaps I took a jaundiced view of everything that night. But I was not dull during dinner, for amongst the people at the table was a young fellow suffering from sunstroke or D.T. He had a pistol, which he presented at the head of a servant whenever he called for anything. This kept things lively, especially when on some one saying, 'It is not loaded,' he replied, 'Oh! isn't it?' and shot at a lamp hanging on the wall, smashing it. This was too much for his neighbours, who seized him, took the pistol, and threw it out of the door. A general row now began, in which not seeing my way to join profitably, I got into the conveyance which was to take me to Allahabad, and drove off.

In due course I arrived at my destination, reported myself to the proper authority, who told me I had better get a staff of servants used to camp-life, as my next two years would most likely be spent under canvas. Easier said than done, especially as I was warned against English-speaking natives. That I quite agreed with, for could not Ramma Sawmy speak it perfectly. There was, however, one exception to this rule; this was a native clerk, whose chief qualification had to be a knowledge of English.

Whilst looking for this member of my staff, my baggage arrived from Calcutta. It was duly delivered, and I looked forward to gazing at my belongings with fond delight; so I did—on what there was; but how little! First I wept, then 'swear-words' came to my relief, and if they were as effective as they were potent, Ramma Sawmy departed before his time to a place where my appropriated clothing would be superfluous. Later on, I heard from home that the cases I delivered to my agents containing, as I believed, choice works of native art, simply covered odd specimens of coarse pottery. What I said when I heard this was of the same nature as the pottery; it will therefore be well if I refrain from repeating it. It will also be well if Ramma Sawmy and his wicked ways be left alone, whilst I relate my first experiences with young Bengal.

I have said my native clerk was expected to know English, and this is what the first applicant for that post sent me as a specimen of his idea of the language:

RESPECTED SIR—I beg to say that my mind is greatly confounded: will you kindly let me know

if I may enter your service or may I go back to my house; Mr — told me verbally that when you start I shall be joined to your staff at —: still I have no result on the subject but now (sir) if your honor give me order I will ascertain the fact what is with all possible means; and having learnt the meaning of the cause I shall act according to my own will; I now beseech your forgiveness in haste; when I would be duly favoured by your kind reply, by your doing so I will lose no time to offer up my Prayer to the almighty father for your long life and prosperity.—I remain, sir, your most obedient servant,

WOMESH CHUNDER BANERJEE.

This literary production was of the sort Huckleberry Finn described as 'interesting but tough;' it was also so peculiar that I longed to see the writer, and *hear* English 'as she is spoke' on the plains of Hindustan. It also occurred to me that I might get this worthy to write my home letters; they would impress my relations with the idea that I was studying the language and getting befogged with it. I therefore sent for Mr Banerjee, who appeared in a spotless white surtout; side spring boots, with their tags standing out at right angles to his legs; close-cropped hair, and an umbrella.

The English language as spoken by young Bengal does not give one the idea of being a plain one—flowery rhetoric and metaphor take the place of our homely phrases, and Mr Banerjee kept these well to the front during our interview. But on the whole he seemed a satisfactory person, and I engaged him.

I have forgotten, I see, to say that, just before leaving Calcutta, Ramma Sawmy wanted an advance in cash, to enable his family to live whilst he was away. He got it, and that fact rankled in my bosom more than all his other delinquencies put together; so, when Mr Banerjee suggested having a month's pay in advance for his family's benefit, my cholera rose, and I 'went for' Mr Banerjee. Luckily for him, I tripped and missed my man, who, with a yell of terror, bolted, his white garments streaming in the wind, his umbrella sailing away like a parachute, whilst spasmodically he shouted: 'Do you want to kill, sir?' No, I didn't; I only wanted to impress on him my views on the subject of monetary advances. It was not to be, though, for Mr Banerjee got safely to a house in the bazaar, where I left him, and hoped the next griffin he came across would be able to run faster than I could.

The next servant whose peculiarities afforded me food for reflection was a jokist, the only native I ever heard of in that line of business. His name was Kurreem Bux, and the way he once 'played it on me' was something any man might be proud of, especially as it was the chance of a lifetime; he grasped the situation and got his reward. A lion had been killed in the Central Provinces, and a friend—a great 'shikari'—told me they always went in couples; if therefore, we could get leave and post down sharp, we might bag the mate of the one shot. Leave was obtained, and away we went. A small staging bungalow, built for some surveyors, was situated in the jungles not far from where we expected to get news of the lion, if it existed;

this we had permission to use, and to it we sent our luggage a day or two in advance. Never shall I forget the place or its inhabitants. They principally consisted of the insect tribe, known entomologically as *Cimex lectularia*. And weren't they hungry! Truly, I believe the fiend in human form who gave us leave to use the place was coming before long to it, and wished his tenants to have the edge taken off their appetites, and we were to do it. But it was not to be; they were too much *en évidence*. One look at them was enough; we left the bungalow, and took up our quarters beneath a banyan tree.

After dinner, we arranged our plan of campaign, and then curled ourselves up to sleep the sleep of the just, just as the moon began to rise. We must have slept long, for when I was disturbed by my man, Kurreem Bux, pressing my foot gently, the moon was well up, and the place nearly as light as day.

'Sahib, sahib,' softly whispered Kurreem, 'there is the lion.'

In a moment I was 'all there.' Yes; certainly I could see the tail half of some animal behind a bush, apparently eating.

'What is he doing there, Kurreem?'

'That is where the cook killed some fowls, and I suppose the lion is eating the entrails.'

Quite satisfied with this explanation, I took my rifle, looked at my chum, who was fast asleep, and crept from bush to bush till I could get a fair shot at the beast. I fired; the bullet went thud, and I waited to see if the other barrel would be wanted.

What a row there was in a moment; the whole place seemed alive with people. My chum was shouting 'What is it?' the servants were bolting right and left; Kurreem was shouting 'A lion, a lion!' and my quarry was kicking away in the bush where it fell.

Now, whilst I was deliberating about the wisdom of going up to a wounded lion, a native appeared from behind a bush close to where I had fired; he went to the animal, and after giving vent to a wail of woe that rent the skies, said—at least, according to the *Delhi Gazette*:

Oh! sir,
Was no other animal ready?
Why couldn't you shoot a jackal or cur,
And spare me my hard-working Neddy!

I had shot a villager's donkey. Kurreem Bux disappeared for several days, and on his return kept at a respectful distance. Eventually I forgave him; and no doubt, when peace was restored, he had many a chuckle as he thought of how he had sold a Sahib.

SOME OLD POLITICAL TOASTS.

THE decline and fall of the old health-drinking customs have naturally rendered the art of political toasting of little account. Beyond the conventional sentiments usually given at party banquets and convivial gatherings—the cause, and the leader—Political Toasts have but little existence. It was much otherwise a century ago. Your toast and your song were not then a figure of speech. Health-proposing and health-drinking were serious matters, and no one could shirk his duty therein. Any member of a dinner-

party or other social gathering was expected, if called upon, to give a sentiment which the rest of the company could honour. Of course, many of these sentiments became stereotyped, and several collections were made containing many hundreds of these favourite accompaniments to good liquor.

As political passion then ran high, and party feeling was inflamed, it is not surprising to find the political toast figuring prominently in the social life of the period. In the course of his Welsh wanderings in 1794, Coleridge was at Bala, and at some public table gave the health of the then famous Dr Priestley of Birmingham; whereupon the loyal parish apothecary, who was present, said: 'I gives a sentiment, gemmen! May all republicans be gullotened!' A comprehensive proposal, and somewhat sanguinary withal, but very pithily expressed. The political toasts of the last century were often marked by great coarseness, and what one might almost call brutality. There are several collections devoted to sentiments of this type, and some of them display amazing ferocity.

Many framers of political toasts were fond of displaying their ingenuity by disguising their exact intentions under some allusive sentiment or phrase of double meaning. On the 24th of January 1798, the birthday of Charles James Fox, there was a great dinner at the famous *Crown and Anchor*. The Whigs assembled in force—two thousand are said to have been present—with the Duke of Norfolk in the chair. The first toast was the health of Fox, and then the Duke proposed successively, 'Rights of the People,' 'Constitutional Redress of the Wrongs of the People,' with other catch-words and phrases which the Whigs then inscribed on their banners. The health of the chairman was drunk, and then the irrepressible Duke gave 'Our Sovereign's Health—the Majesty of the People!' This was sailing rather too near the wind, and the king promptly dismissed the Duke from his various offices. On the 1st of May in the same year, the Whig Club had a dinner at the *Freemasons' Tavern*, and Fox repeated the offence by giving as a toast, 'The Sovereignty of the People of Great Britain.' As soon as the king heard of this performance, he ordered the great Whig's name to be erased from the list of Privy Councillors.

Toasts of this character were not confined to public gatherings. At private dinners the custom of proposing sentiments was universal, and when ardent politicians got their knees under the same table, the toasts given reflected the political views of those assembled. When Samuel Rogers was a young man of twenty-nine, he once dined at a friend's house with Thomas Paine, freethinker and republican. One of the toasts given was the 'Memory of Joshua,' with reference, no doubt, to the Hebrew leader's conquest of the kings of Canaan, and his disposal of them thereafter by hanging and otherwise. Paine observed that he would not treat kings like Joshua. 'I'm of the Scotch parson's opinion,' he said, 'when he prayed against Louis XIV.—"Lord, shake him over the mouth of hell, but don't let him drop!"' Paine then gave as his contribution to the toast-list, 'The Republic of the World,' which Rogers noted as

a sublime idea. It was a kind of anticipation of the Laureate's lines in *Locksley Hall*:

Till the war-drums throbbed no longer, and the battle flags were furled
In the Parliament of man, the Federation of the world.

In Ireland in 1803, when aid from France was expected by those disaffected towards the English rule, a popular toast was 'The Feast of the Pass-over.' Early in the present century, Pitt Clubs were very numerous throughout the country. They were founded in support of that great minister's policy during the titanic struggle with Napoleon, and continued to flourish long after Waterloo had finally ended that contest. The favourite toasts were, 'The Duke of Wellington,' 'The Gallant Blücher,' and then, 'True Blue and Prussian Blue—the colours that beat Bonaparte black and blue!' It has been ingeniously surmised that this toast, and the popularity at that time of the Prussians, gave rise to Sam Weller's singular form of welcome to his father, whom he saluted with, 'Vell, my Prooshan Blue!'—a phrase which was unintelligible to the competitors for Mr C. S. Calverley's prizes, given in 1857, for proficiency in the 'Pickwick Papers,' and was even a stone of offence to the learned examiner himself.

The Jacobites were extremely ingenious in their methods of showing convivial disloyalty without too openly committing themselves. Every one knows the method of drinking the health of the king 'over the water;' but this was only one of many devices. In 1715 they were fond of toasting an individual called Job. This was not the much-tried man of infinite and proverbial patience, but simply a combination of the initials of James, Ormonde, and Bolingbroke. Other favourites were 'Kit'—which in the same way represented King James Third—and 'the three Bs,' which mystery meant Best Born Briton, and so the Chevalier. In earlier days, during the Commonwealth, the Cavaliers are said to have expressed their feelings towards the usurper by a tolerably transparent device. They put a crumb of bread into their glass, and then, before drinking it off, exclaimed, 'God send this *crumb well down*!' For a long time after King William III. met his death from his horse having stumbled over a molehill in the park of Hampton Court Palace, the Jacobites kept the memory of the humble earth-borer fresh by drinking to the health of the 'Little gentleman in black velvet.' Among the wilder spirits, the health-drinking was not complete unless it were performed on the bared knees. As Wildrake sings in *Woodstock*:

Then let the health go round;
For though your stocking be of silk,
Your knee shall kiss the ground, a-ground, a-ground,
a-ground,
Your knee shall kiss the ground.

On the other side, the supporters of the settlement of 1688, and all who detested the Stuarts, had plenty of sentiments whereby to testify, in bacchanalian moments, to their loyalty to the House of Hanover. The famous 'Calves'-head Club' distinguished itself in this connection. Their favourite day of meeting and holding high festival was January 30, the anniversary of the execution of King Charles I., and their toasts smack of the brutality of the time. Among their

sentiments were, 'The Pious Memory of Oliver Cromwell,' 'The Glorious Year 1648,' 'The Man in the Mask'—referring to the king's executioner—and others of similar hue. We have travelled a long distance since such toasts as the last named could be tolerated in decent society. The most devoted admirer of the rule of Oliver Cromwell would hesitate nowadays to toast that 'Man in the Mask' whose personality is as little capable of satisfactory identification as is his of the Iron Mask. Political sentiments do not now go hand in hand with the flowing bowl—the overflowing bowl—as they used to do, and political toasts, except of the most conventional kind, are practically extinct.

IN AUTUMN DAYS.

Do you think of the long ago, sweet heart,
As we stand by the old brook's side,
And, russet and brown, the leaves float down
To drift away with the tide?
Do you think of the days gone by,
When we sat by this dimpled stream
Dreaming for hours 'mid its gay wild flowers,
As only youth can dream?

The haws are ripe on the fading boughs
Where the thrushes used to sing,
When the sky was blue and the blossom new
In the fresh and joyful Spring;
And I dared to plead my love
Till your lips sweet answer gave,
While, rich and bright, the quivering light
Lay on the silver wave.

You say we are older now—and wise;
And the time of dreams is o'er,
For our children play on the sunny way
Where we kept our tryst before.
So you pluck the crimson haws,
Which are stirred by no brown wing,
And give a sigh to the days gone by,
And the vanished bloom of Spring.

But look up into my face, sweet heart!
You have been my wife for years:
We have had our share of toil and care,
And wept together some tears.
Yet our hearts have aye been bound
In a bond so truly blest,
That I cannot tell (I love so well)
If Autumn or Spring is best.

E. MATHESON.

PRICE 1½d.

A RUSSIAN 'DAY OF RECOLLECTION.'

THE Russian people are perhaps, of all European nationalities, the most tenaciously conservative in the maintenance of their ancient national customs, holidays, and Church observances. Whilst many of their ceremonies are somewhat interesting, and even sensational in their character to the traveller, none can be possibly more so than the popular holiday known amongst the Russians as the 'Day of Recollection,' or 'Festival over the Dead.' On the morning of the 28th of July, Russian style, or 9th of August, English style, whilst on a visit to St Petersburg, we were informed that this annual holiday was to be observed in the churchyard of Smolensk, situated in Vasili Ostrof. Accompanied by an interesting and intelligent Scot, who has been located in Russia for nearly thirty years, and who, accordingly, knows the Russian language as well as his mother-tongue, we proceeded to the scene of action. We were not long of being made aware of the fact that something of an unusual character was going on in the city. At the tram-car starting-point we found quite a crowd of people collected, most of whom carried well-loaded bags, bundles, and baskets, and looked as if they were setting out on a somewhat lengthened journey. Car after car was loaded and despatched only to be succeeded by others. To escape the crowd, we secured a drosky. The farther we proceeded, the greater the throng became. It reminded us of the crowds we have seen hurrying along to the race-meetings or important fairs in our own country. When we got within half a mile of the church of Smolensk, the long avenues, broad streets, and lanes looked almost solid with people. As the police would not allow our drosky-man to proceed farther, owing to the block, we had to dismount, leave our driver to fall into his place behind a long line of vehicles of every description, and follow the crowd on foot. It was a crowd certainly as big as desirable, but perfectly manageable. Everybody was in holiday dress and in holiday humour. Many carried

large memorial wreaths beautifully decorated with flowers. There was nothing of a sombre hue in all that crowd. The memorial wreath was being borne along as gaily as if it had been a marriage bouquet. It was difficult for us to believe that these people were moving to a field of the dead. Besides those carrying flowers, there were others carrying provisions, bread (black and white), teapots, tea-urns, hot-water urns, and bottles of all shapes and sizes.

When at a crawling pace we reached the entrance to the church and churchyard, we found a detachment of police drawn up. As the people passed through the archway the police moved about in search of 'vodka' or spirit bottles, an order having been issued by the chief that all vodka bottles were to be seized. Having passed this entrance, we now reached the short avenue to the church of Smolensk. Here it was "all excitement and a perfect babel of sounds, and in respect of noise and numbers not unlike a gigantic Scotch or English fair of the olden times. Here, however, the comparison ceases. On the right of the entrance to the church stood a large open booth constructed of canvas, supported by poles. It was literally packed with religious devotees. At one end was erected an altar with sacred relics and 'ikons' and everything quite in accordance with the high ritual of the Russian Church. It was a dazzling, gaudy show of tawdry gold and silver ornamentation in full blaze with tapers and candles. Outside, a good sale of tapers was going on. Within this booth many were on their knees, others were kissing the glass coverings of the pictures of the saints, or crossing themselves and displaying their religious fervour in many strange ways. One man quite as earnest as his fellow-devotees in bowing, kneeling, crossing himself, and kissing the pictures of the saints, carried a formidable bottle in his pocket. On one side of the entrance stood ten nuns of dark, swarthy complexions, dressed in black and wearing hats of various shapes, sugar-loaf and cylindrical, from which long heavy black veils were suspended. These nuns had come from the

remote interior, and were on a begging tour for the poorer country churches. There were men also eagerly clamouring for contributions for certain churches burned down in the interior. Not far off was a miscellaneous lot of lame, halt, and blind soliciting alms. This booth was well patronised; and the money drawn from the sale of tapers and candles, in addition to the voluntary contributions, must have brought a fair harvest to those who presided over it.

Leaving this extraordinary exhibition of devotion, superstition, and imposition, we crossed over to see what was doing within the church of Smolensk. Within the porch stood two rows of miserable creatures, old and middle-aged. The sight of this abject collection of humanity was positively sickening for its sadness. Round the porch were people engaged in the sale of charms, trinkets, curios, and flowers. The church of Smolensk, which is dedicated to the Virgin, looks a somewhat aged structure, notwithstanding the whitewash and paint which have not been spared upon it. Its altar is a fine one, and of course there is no lack of sacred pictures—gold, silver, and jewelled ornamentation—candelabra, paintings, frescoes, banners, rare old service-books, and other objects of religious veneration. As the worshippers entered, very many of them purchased candles and tapers, proceeded with them to the altar, and after lighting them there, they placed them in the candelabra reserved for such offerings. The church is now quite ablaze with light, and presents a spectacle—as the gold, silver, and jewelled treasures glisten so dazzlingly—which moves the worshippers. The pictures of the Saviour and the Virgin were special objects of veneration, and all eagerly pressed forward in succession to kiss those holy pictures. There were some people kissing the floor of the church, others were devoutly crossing themselves and kneeling. Very few could be charged with remissness. In the centre of the church stood pitchers full of holy-water, around which the people were congregating, eager to get the tin cups into their hands. The water was disposed of in cupfuls. Mothers were encouraging and pressing their children to partake of it, while some were even putting it into the mouths of tender infants. The floor of the church was thick with sand, caused by the traffic of so many feet. A miracle-working picture of the Virgin Lady of Smolensk attracted much attention, and many kisses were lavished on the glass which protected it. Whilst we were examining with some interest this highly venerated work of art, a woman dressed like a peasant approached us carrying a basket covered with a white cloth. From this basket she produced a small phial containing an oily-looking liquid, which she offered for sale. It had been specially blessed, she said, by coming in contact with the miracle-working Virgin, and was warranted to cure all manner of diseases. Strongly she pressed its

virtues upon us, saying, ‘Although you are Germans and foreigners and dumb to what is going on, you ought to make some sacrifice for the mother of God.’ As we still declined to make the purchase, she opened the cork, put some of the oil on the tip of her finger, and was about to proceed to anoint us; however, at this point we slipped through the crowd and escaped her further attentions.

The heat now growing stifling, the smell by no means the most fragrant—around us nothing but kissings, genuflections, prostrations, crossings, and drinking of the holy-water increasing rather than diminishing, we made our way out of the church to enjoy a little fresh air in the churchyard. The main avenues were crowded. There were priests, police, soldiers, sailors, artisans, boatmen in their red shirts outside their trousers, and picturesquely attired women and children promenading to and fro. There were vendors of fruit, flowers, sweets, and Seltzer water stationed here and there. There was, however, no jostling, no rudeness in all that crowd. The humblest ‘moujik’ was greeting the other by taking his cap off, shaking him by the hand, and from his heart wishing him all happiness. There was the utmost courtesy and kindness manifested by every one to young and old. Different classes moved freely together. There was no stiffness, no formality, no reserve.

The churchyard of Smolensk, we were informed by an officer of police, is one hundred and twenty acres in extent, and the number of grave-diggers employed is twenty-four. We have seen many lamentably neglected and insanitary churchyards in our own country; we have seen nothing, however, like this. It is simply a wild, neglected field of rank grass, neglected trees, and shrubs enclosed by a hideous wooden fence. There are avenues and roads broad and narrow intersecting it, but all neglected and unkept. The monumental stones are nearly as thick as they can be planted. There are obelisks, flat stones, pillars, miniature chapels, shrines, stones in every conceivable shape and form, picturesque and grotesque, and attached to every stone is the ‘ikon,’ or holy picture. On many of the monuments lamps were burning, and on numerous graves were lighted candles. The most common form of monumental design, however, was the Greek cross, in stone or wood, and in some cases in plain rough logs and posts. There were other tombs like caves, grottoes, rockeries, and mounds of turf of pyramid shape. Some resembled ordinary wooden packing-boxes, others again closely resembled large umbrellas and parasols. The decorations were in some cases lavish, and very beautiful indeed. Roses, everlastings, heather, dried flowers, and wreaths of brilliant colours were lovingly bestowed as offerings and memorials.

As we turn away from the main avenues to wander amongst the tombs, what a remarkable sight presented itself! In every direction there

were family parties holding picnics amongst the graves. Within many a little grave enclosure, a table stood, spread with eatables and drinkables, and the family party sat round as happy looking as if they were picnicking in the woods. Other family groups were seated in large aviary-like structures made of wood and wire-netting, with tables spread within and seats all round. Within these enclosures feasting with their relatives were many types of St Petersburg society, from the well-clad, highly respectable-looking men of business down to the humblest and poorest labourer, and not a sad face amongst them. This resting-place of the dead was transformed to-day into a scene of festivity. Some tables were covered with the usual tea-party provisions, others again with the more solid materials of the supper-table. Teapots and tea-urns were everywhere. The chief drink was 'vodka,' which, notwithstanding the police prohibition, was too conspicuously present. There is a group, and it is not the only one, seated round a table, well furnished with Russian sausages, buns, black bread, fish, and small cucumbers, and too intent over the vodka. The children are playing around, having disposed of their cloaks and hats on the family gravestone. There is an old man, bald-headed, in his red shirt over his trousers and long boots, seated on the family burying-ground with his aged wife beside him, and before them eggs, cucumbers, and black bread. It is a very strange, yet pathetic sight. It is impossible for them to look happier than they do now.

As we moved along, we heard the sounds of chanting. Here was a family party of men and women, most respectable looking and well clad, kneeling together on the family burial-ground. A priest in deep sonorous tones was reciting or singing the 'panebeda,' or the requiem for the dead. The others crossed themselves, waved their hands, kissed the ground, and seemed intensely agitated. The priest alone stood up, full bearded and moustached, and with long streaming hair. On his head he wore a cylindrical hat of purple velvet, over his shoulders a shawl-like garment of silver and gold braided work, with large gold crosses behind, and in his hand he carried a censer. The service only lasted a few minutes. The fee of twenty copecks (fivepence) was then handed to the priest, who withdrew for duty elsewhere. As soon as the service was over, there was mutual congratulation, and on every face there was an expression of delightful satisfaction. Down immediately they sat together around the well-furnished table, and there they feasted. As we wandered about, the voices of the multitude reminded us of the sound of the sea. Here is an enclosure with eleven persons seated within feasting gaily and drinking vodka.

Changing our route, we came to the finest monument in the churchyard, and, let it be said, one that is kept in a singularly tasteful and creditable condition. This is the monument erected in memory of those soldiers of the Finnish Regiment of Guards who perished in the explosion in the Winter Palace some years ago. The monument is a very handsome granite structure, planted on an artificial mound. It is of obelisk shape, and its top is surmounted by a

jewelled golden cross placed on a gilded globe. On the face of the obelisk are printed the names of the unfortunate soldiers. The decorations are of a purely military character, comprising Russian eagles, bayonets, cuirasses, helmets, swords, guns, and cannon tastefully arranged; whilst the graves are beautifully decorated with wreaths and flowers and strewn with rice. This monument was surrounded by numerous spectators, who showed their respect for the dead and their veneration for the holy pictures near it by uncovering and crossing themselves.

After leaving this interesting memorial, we continued our walk, and everywhere there was very much the same thing to be seen—religious fervour and devotion commingled with drinking, feasting, and merriment. Seated on a little enclosure with his wife and relatives we came upon a burly lieutenant of police well known to our friend. We halted to get some information from him. He informed us that he had some children buried within this enclosure, and that now he was having a glorious day. Turning to the writer, he said: 'Ah, our friend has never seen the like of this in his country. They have nothing like this in Schottland.' When we asked him about the vodka-drinking connected with this Recollection Day, he replied: 'Why, the police order is, there must be no vodka; however, all the same the more vodka comes.' He also informed us that this was the oldest cemetery in St Petersburg, and it was estimated that hundreds of thousands of bodies had been interred here, and that from time immemorial those strange rites which he was engaged in had been observed.

Leaving our friend to enjoy himself, we came upon some flat tombstones sprinkled with rice, and others strewn with black bread, white bread, and hard-boiled eggs crumbled down, as oblations to the dead. There were also several very curious circular and square wire-netted enclosures containing memorial crosses. There is a large enclosure closely resembling a cage in the Zoological Gardens in which three massive wooden Greek crosses stand covered with beautiful wreaths and flowers; whilst seated in true picnic-like style is a merry group of individuals feasting.

We have now reached another church. Beggars are standing round the doors, crying: 'Remember the poor churches in the interior!' 'Remember the church of Michael the Archangel!' Several nuns also, with fur round their long-veiled hats, were imploring for assistance. Near this church we were attracted by an old tombstone covered with written papers. We inspected some of them, and they proved to be the petitions for prayers for the dead given to the priests. Having been disposed of, they were apparently thrown out to make room for others. Many of those sheets of note-paper contained long lists of names of the departed.

Making our way out of the churchyard, we saw near the church of Smolensk a man beating an iron plate suspended from the branch of a tree, as a signal for the people to withdraw. Passing through the gates, we noticed the police keeping a sharp lookout for pickpockets, those plagues of Russian crowds. A 'tractir' or restaurant planted at the very church gate was doing a roaring trade. Outside, the scene was one of great animation.

Every upper window had its occupants. The streets were crowded, the drosky-men in long lines were drawn up, waiting for patrons, and the noise from the innumerable overflowing tractors or cafés was simply deafening.

So terminated this remarkable day spent in the churchyard of Smolensk. When such a holiday as this was instituted, who can tell? It belongs to the dim and distant past, and is a relic of semi-barbarous times. It carried our minds at once back over the long centuries to the days of old pagan rites and practices. We had read in classical authors how the Roman sepulchres were bespread with flowers and covered with crowns and fillets, how the little altar was erected, on which libations were made and incense burned, and how the ancient tombs were frequently illuminated with lamps. We had read of the feast the *Silicernium*, kept both for the living and the dead associated with it, and how certain things, such as beans, lettuce, bread, and eggs, were laid on the tombs as the *cæna feralis*. It was remarkable indeed to find something not unlike this a recognised ceremony in the Russian church, and a living and popular institution in a civilised and cultured capital like St Petersburg.

BLOOD ROYAL.*

CHAPTER XIII.—AN UNEXPECTED VISITOR.

His father's death put Dick at once in a very different position from the one he had previously occupied. It was a family revolution. And on the very evening of the funeral, that poor shabby funeral, Dick began then and there to think the future over.

Poor people have to manage things very differently from rich ones; and when Edmund Plantagenet was laid to rest at last in the Oxford cemetery, no member of the family save Dick himself was there to assist at the final ceremony. Only Gillespie accompanied him to the side of the grave, out of all the College; but when they reached the chapel, they found Gillingham standing there hatless before them—urged, no doubt, by some late grain of remorse for his own prime part in this domestic drama; or was it only perhaps by a strong desire to see the last act of his tragedy played out to its bitter climax? After the ceremony, he left hurriedly at once in the opposite direction. The two friends walked home alone in profound silence. That evening, Gillespie came up to Dick's rooms to bear him company in his trouble. Dick was deeply depressed. After a while, he grew confidential, and explained to his friend the full gravity of the crisis. For Mr Plantagenet, after all, poor weak sot though he was, had been for many years the chief bread-winner of the family. Dick and Maud, to be sure, had done their best to eke out the housekeeping expenses, and to aid the younger children as far as possible; but still, it was the father on

whose earnings they all as a family had depended throughout for rent and food and clothing. Only Maud and Dick were independent in any way; Mrs Plantagenet and the little ones owed everything to the father. He had been a personage at Chiddingwick, a character in his way, and Chiddingwick for some strange reason had always been proud of him. Even 'carriage company' sent their children to learn of him at the *White Horse*, just because he was old Plantagenet, and a certain shadowy sentiment attached to his name and personality. Broken reprobate as he was, the halo of past greatness followed him down through life to the lowest depths of degradation and penury.

But now that his father was dead, Dick began to realise for the first time how far the whole family had been dependent for support upon the old man's profession. Little as he had earned, indeed, that little had been bread and butter to his wife and children. And now that Dick came to face the problem before him like a man, he saw only too plainly that he himself must fill the place Mr Plantagenet had vacated. It was a terrible fate, but he saw no way out of it. At one deadly blow all his hopes for the future were dashed utterly to the ground. Much as he hated to think it, he saw at once it was now his imperative duty to go down from Oxford. He must do something without delay to earn a livelihood somehow for his mother and sisters. He couldn't go on living there in comparative luxury while the rest of his family starved, or declined on the tender mercies of the Chiddingwick workhouse.

Gradually, bit by bit, he confided all this, broken-hearted, to Gillespie. There were no secrets between them now; for the facts as to poor Mr Plantagenet's pitiable profession had come out fully at the inquest, and all Oxford knew that night that Plantagenet of Durham, the clever and rising history man, who was considered safe for the Marquis of Lothian's Essay, was after all but the son of a country dancing-master. So Dick, with a crimson face, putting his pride in his pocket, announced to his friend the one plan for the future that now seemed to him feasible—to return at once to Chiddingwick and take up his father's place, so as to keep together the *clientèle*. Clearly he must do something to make money without delay; and that sad resolve was the only device he could think of on the spur of the moment.

'Wouldn't it be better to try for a school-mastership?' Gillespie suggested cautiously. He had the foresight of his countrymen. 'That wouldn't so much unclass you in the end as the other. You haven't a degree, of course, and the want of one would naturally tell against you. But you might get a vacant place in some preparatory school—though the pay, of course, would be something dreadfully trivial.'

'That's just it,' Dick answered, bursting with

* Copyright 1892 in the United States of America by the Cassell Publishing Company.

shame and misery, but facing it out like a man. 'Gillespie, you're kindness itself—such a dear good fellow—and I could say things to you I couldn't say to anybody else on earth that I know of, except my own family. But even to you I can't bear to say what must be said, sooner or later. You see, for my mother's sake, for my sisters', for my brothers', I *must* do whatever enables me to make most money. I must pocket my pride—and I've got a great deal—ever so much too much—but I must pocket it, all the same, and think only of what's best in the end for the family. Now, I should *hate* the dancing—oh, my dear, dear fellow, I can't tell you how I should hate it! But it's the one thing by which I could certainly earn most money. There's a good connection there at Chiddingwick, and it's all in the hands of the family. People would support me because I was my father's son. If I went home at once, before anybody else came to the town to fill the empty place, I could keep the connection together; and as I wouldn't spend any money—well, in the ways my poor father often spent it, I should easily earn enough to keep myself and the children. It'll break my heart to do it; oh, it'll break my heart; for I'm a very proud man; but I see no way out of it. And I, who hoped to build up again by legitimate means the ruined fortunes of the Plantagenets!'

Gillespie was endowed with a sound amount of good Scotch common-sense. He looked at things more soberly. 'If I were you,' he said in a tone that seemed to calm Dick's nerves, 'even at the risk of letting the golden opportunity slip, I'd do nothing rashly. A step down in the social scale is easy enough to take; but once taken, we all know it's very hard to recover. Have you mentioned this plan of yours to your mother or sister?'

'I wrote to Maud about it this evening,' Dick answered sadly, 'and I told her I might possibly have to make this sacrifice.'

Gillespie paused and reflected. After a minute's consideration, he drew his pipe from his mouth and shook out the ashes. 'If I were you,' he said again, in a very decided voice, 'I'd let the thing hang a bit. Why shouldn't you run down to Chiddingwick to-morrow and talk matters over with your people? It costs money, I know; and just at present, I can understand, every penny's a point to you. But I've a profound respect for the opinions of one's women in all these questions. They look more at the social side, I'll admit, than men; yet they often see things more clearly and intelligently, for all that, than we do. They've got such insight. If they demand this sacrifice of you, I suppose you must make it; but if, as I expect, they refuse to sanction it, why, then, you must try to find some other way out of it.'

Gillespie's advice fell in exactly with Dick's own ideas; for not only did he wish to see his mother and Maud, but also he was anxious to meet Mary Tudor again and explain to her with regret that the engagement which had never existed at all between them must now be ended. So he decided to take his friend's advice at once, and start off by the first train in the morning to Chiddingwick.

He went next day. Gillespie breakfasted with him, and remained when he left in quiet possession of the armchair by the fireside. He took up a book—the third volume of Mommsen—and sat on and smoked, without thinking of the time, filling up the interval till his eleven o'clock lecture. For at eleven the senior tutor lectured on Plato's *Republic*. Just as the clock struck ten, a hurried knock at the door aroused Gillespie's attention. 'Come in!' he said quickly, taking his pipe from his mouth. The door opened with a timid movement, standing a quarter ajar, and a pale face peeped in with manifest indecision. 'A lady!' Gillespie said to himself, and instinctively knocked the unconsumed tobacco out of his short clay pipe as he rose to greet her.

'Oh, I beg your pardon,' a small voice said in very frightened accents. 'I think I must be mistaken. I wanted Mr Richard Plantagenet's rooms. Can you kindly direct me to them?'

'These are Mr Plantagenet's rooms,' Gillespie answered as gently as a woman himself, for he saw the girl was slight, and tired, and delicate, and dressed in deep mourning of the simplest description. 'He left me here in possession when he went out this morning, and I've been sitting ever since in them.'

The slight girl came in a step or two with evident hesitation. 'Will he be long gone?' she asked tremulously. 'Perhaps he's at lecture. I must sit down and wait for him.'

Gillespie motioned her into a chair and instinctively pulled a few things straight in the room to receive a lady. 'Well, to tell you the truth,' he said, 'Plantagenet's gone down this morning to Chiddingwick. I—I beg your pardon, but I suppose you're his sister.'

Maud let herself drop into the chair he set for her, with a despondent gesture. 'Gone to Chiddingwick! Oh, how unfortunate!' she cried, looking puzzled. 'What am I ever to do? This is really dreadful.' And indeed the situation was sufficiently embarrassing; for she had run up in haste, on the spur of the moment, when she received Dick's letter threatening instant return, without any more money than would pay her fare one way, trusting to Dick's purse to frank her back again. But she didn't mention these facts, of course, to the young man in Dick's rooms, with the blue-and-white boating jacket, who sat and looked hard at her with profound admiration and sympathy, reflecting to himself meanwhile how very odd it was of Plantagenet never to have given him to understand that his sister was beautiful! For Maud was always beautiful, in a certain delicate, slender, shrinking fashion, though she had lots of character; and her eyes, red with tears, and her simple little black dress, instead of spoiling her looks, somehow served to accentuate the peculiar charms of her beauty.

She sat there a minute or two, wondering what on earth to do, while Gillespie stood by in respectful silence. At last she spoke. 'Yes, I'm his sister,' she said simply, raising her face with a timid glance towards the strange young man. 'Did Dick tell you when he was coming back? I'm afraid I must wait for him.'

'I don't think he'll be back till rather late,' Gillespie answered with sympathy. 'He took his

name off Hall ; that means to say,' he added in explanation, 'he won't be home to dinner.'

Maud considered for a moment in doubt. This was really serious. Then she spoke once more, rather terrified. 'He won't stop away all night, I suppose?' she asked, turning up her face appealingly to the kindly-featured stranger. For what she could do in that case, in a strange big town, without a penny in her pocket, she really couldn't imagine.

Gillespie's confident answer reassured her on that head. 'Oh no, he won't stop away,' he replied, 'for he hasn't got leave ; and he wouldn't be allowed to sleep out without it. But he mayn't be back, all the same, till quite late at night—perhaps ten or eleven. It would be hardly safe for you, I think, to wait on till then for him. I mean,' he added apologetically, 'it might perhaps be too late to get a train back to Chiddingwick.'

Maud looked down and hesitated. She perused the hearth-rug. 'I think,' she said at last, after a very long pause, 'you must be Mr Gillespie.'

'That's my name,' the young man answered, with an inclination of the head, rather pleased she should have heard of him.

Maud hesitated once more. Then, after a moment, she seemed to make her mind up. 'I'm so glad it's you,' she said simply, with pretty womanly confidence ; 'for I know you're Dick's friend, and I daresay you'll have guessed what's brought me up here to-day even in the midst of our great trouble. Oh, Mr Gillespie, did he tell you what he wrote last night to me?'

Gillespie gazed down at her. Tears stood in her eyes as she glanced up at him piteously. He thought he had never seen any face before so pathetically pretty. 'Ye-es, he told me,' the young man answered, hardly liking even to acknowledge it. 'He said he thought of going back at once to Chiddingwick, to take up—well, to keep together your poor father's connection.'

With a violent effort, Maud held back her tears. 'Yes, that's just what he wrote,' she went on, with downcast eyes, her lips trembling as she said it. Then she turned her face to him yet again. 'But, oh, Mr Gillespie,' she cried, clasping her hands in her earnestness, 'that's just what he must never, never, never think of!'

'But he tells me it's the only thing—the family has—to live upon,' Gillespie interposed, hesitating.

'Then the family can starve!' Maud cried, with a sudden flash of those tearful eyes. 'We're Plantagenets, and we can bear it. But for Dick to leave Oxford, and spoil all our best hopes for him—oh, Mr Gillespie, can't you feel, it would be too, too dreadful? We could never stand it.'

Gillespie surveyed her from head to foot in admiration of her spirit. Such absolute devotion to the family honour struck a kindred chord in his half-Celtic nature. 'You speak like a Plantagenet,' he answered very gravely, for he too had caught some faint infection of the great Plantagenet myth. 'You deserve to have him stop. You're worthy of such a brother. But don't you think yourself it would be right of him—as he does—to think first of your mother and his sisters and brothers?'

Maud rose and faced him. 'Mr Gillespie,' she cried, clasping her hands, and looking beautiful as she did so, 'I don't know why I can speak to

you so frankly : I suppose it's because you're Dick's friend, and because in this terrible loss which has come upon us so suddenly we stand so much in need of human sympathy. But, oh—it's wrong to say it, of course, yet say it I must ; I don't care one penny whether it's right or whether it's wrong ; let us starve or not, I do, do want Dick to stop on at Oxford!'

Gillespie regarded her respectfully. Such courage appealed to him. 'Well, I daresay I'm as wrong as you,' he answered frankly ; 'but, to tell you the truth—so do I ; and I honour you for saying it.'

'Thank you,' Maud cried, letting the tears roll now unchecked, for sympathy overcame her. She fell back again into her chair. 'Do you know,' she said unaffectedly, 'we don't care one bit what we do at Chiddingwick ; we don't care, not one of us! We'd work our fingers to the bone, even Nellie, who's the youngest, to keep Dick at Oxford. We don't mind if we starve, for we're only the younger ones. But Richard's head of our house now, heir of our name and race : and we were all so proud when he got this Scholarship. We thought he'd be brought up as the chief of the Plantagenets ought to be.' She paused a moment and reflected ; then she spoke again. 'To leave Oxford would be bad enough,' she went on, 'and would cost us all sore ; it would be a terrible blow to us ; though I suppose that's inevitable : but to come back to Chiddingwick, and take up my dear father's profession—oh, don't think me undutiful to his memory, Mr Gillespie, for our father was a man—if you'd known him long ago, before he grew careless—a man we had much to be proud of—but still, well, there ! if Dick was to do it, it would break our very hearts for us.'

'I can see it would,' Gillespie answered, glancing away from her gently, for she was crying hard now. His heart warmed to the poor girl. How he wished it had been possible for him to help her effectually !

Maud leaned forward with clasped hands and spoke still more earnestly. 'Then you'll help me with it?' she said, drawing a sigh. 'You'll work with me to prevent him? I know Dick thinks a great deal of your advice and opinion. He's often told me so. You'll try to persuade him not to leave Oxford, won't you?—or if he leaves, at least not to come back to Chiddingwick? Oh, do say you will!—for Dick's so much influenced by what you think and say. You see, he'll want to do what's best for us—he's always so unselfish. But that's not what we want : you must try and make him neglect us, and think only of himself ; for the more he thinks of us, the more unhappy and ashamed and desperate he'll make us ; and the more he thinks of himself, why, the better we'll all love him.'

It was a topsy-turvy gospel : but one couldn't help respecting it. Gillespie rose and 'sporting the oak'—closed the big outer door, which stands as a sign in all Oxford rooms that the occupant is out, or doesn't wish to be disturbed, and so secures men when reading from casual interruption. He told Maud what he had done ; and Maud, who had been brought up too simply to distrust her brother's friend, or to recognise the rules of polite etiquette on such subjects, was grateful to him for the courtesy. 'Now, we must talk this out

together,' he said, 'more plainly and practically. It's a business matter: we must discuss it as business. But anyhow, Miss Plantagenet, I'll do my very best to help you in keeping Dick on at Oxford.'

A NEW WORLD FOR THE CAMEL.

THE Soudan Expedition gave Australians their first important lesson in the uses of the camel. Before that they regarded the beast as an interesting object in natural history, and of a certain commercial value in some little-known parts of the world; but it never seriously entered their heads to turn it to regular practical account on their own vast plains. Over fifty years ago a few enthusiasts endeavoured to excite attention to the benefits which would accrue from using the camel as a beast of burden; the early Governors pressed the matter with spirit at various junctures from the establishment of Botany Bay, and many of the explorers were distinctly favourable to the employment of the animals. But these influences were utterly powerless to effect the purpose contemplated. The population had brought with them a knowledge of the horse and ox, and these they used in their carrying-enterprises over a continent as little adapted in many respects to those particular animals as are the plains of Central Asia. The young men who answered the call to arms in the panic of a few years ago were, however, in great proportion natives of the soil, and although inheriting a fixed regard for horse and bullock, they were not blind to the special uses they saw made of the camel along the skirts of Arabian deserts. When they returned, they brought with them a wider view of things; and while, admitting that much of Australia suits the horse-team and bullock-team, they were equally emphatic in declaring that much more of the country seemed destined by nature to be the carrying-ground of the camel alone. The new idea is growing, and already five lines of camel traffic have been opened up and are in regular work. Altogether, over two thousand camels are in daily march.

Once the camel comes to be generally known, rivalry of horse and ox will in the interior of the country be out of the question. Except on the coast districts, the bullock has almost excluded the horse already. On the great inland plains, travelling day by day over barren spinifex country, the horse was found too valuable an animal for the work before him. The bushman's solid work was done by bullocks. But what sort of expeditions were those trips of his? He yoked ten or a dozen bullocks to his dray or wagon; he drove as many more along before; so that when accidents happened he would have substitutes; and he did his three or five hundred miles in a period, and amid privations and hardships, which almost invariably made a gap in his life. Ten miles a day is a fair average for a team of bullocks. They must be turned out before sundown to feed and water; and if food or water is scarce, they have to be looked after

carefully during the night. The teamster must keep on foot all day, accompanying them with comments complimentary or objurgatory, as occasion requires; or urging them with his long echo-raising whip to dash over a pinch in a hill or a rut in a creek. He is sometimes eight or ten months from home at a stretch, and there are cases recorded when his trip covered over two years. Occasionally he takes his wife and young children with him, and then his life is simply that of a gipsy, with the romance taken out and the hardest of hard work put in.

The immediate consequence of substituting camels for bullocks will be the shortening of those long trips. A camel will do eighty-four miles in eighteen hours with three hundred pounds on his back. To go that distance would take the average bullock team ten or eleven days. From the stand-point of civilisation, this is of the highest moment. It is nothing for men to pierce the desert on a trip of exploration, returning in a year or two years or after a longer interval; but it is a serious matter for a man to undertake the making of a home and rearing of a family while his ordinary occupation is one which keeps him almost continually on the road. But the camel will be also cheaper. The wear and tear of bullock-flesh take away half the profits. Bullocks are stupid animals. Yoke them together when breaking them in, and if they can get a tree between them there will be at least one broken neck. They will walk down the steep bank of a waterhole and drown themselves. They starve in dry country and bog in wet. The camel is, on the other hand, a rational beast. He can find his own living wherever he may be. Forms of vegetation which other animals pass by, the camel thrives on. Thistles are one of his luxuries. Above all, his ability to do without water for a lengthened period marks him out as the true beast of burden for the Australian interior.

Points of objection are, it is true, still raised against him. He is said to frighten other animals. The ordinary stockhorse takes to the bush as soon as his eye lights on the ungainly-looking creature. Cattle flee from him in terror. But that is merely because he is as yet strange to them. Familiarity will remove that objection. When evening comes, the bullocks are merely unhitched from the wagon, and the goods remain as they are until the wagon is hitched on next day and the journey renewed. With camels, each has to be unloaded each night and loaded up again on the following morning, necessitating the periodic handling of bales and packages. This is certainly a disadvantage, and goods often reach their destination in a damaged state in consequence; but there are various ways of lessening the evil, if not of preventing it, and experience is rapidly supplying the requisite knowledge. There are other objections; but taking the good with the bad, the camel remains among the most desirable acquisitions the Australian inlands can cultivate. Over one million square miles of the country are still unknown desert. West Australia alone has six hundred and fifty thousand square miles, supposed to consist of arid plains, salt lakes, and mud-flats, but practically outside the sphere of our information. These wide deserts have work for a million camels; while the

highways running into them and connecting them with the oases of civilisation in one part and another should give constant occupation to at least three times as many.

RALPH THORNLEIGH'S PICTURE.

CHAPTER II.

It need hardly be said that when Miss Macallan again approached Beatrice on the subject of her artist-lover she found her as firm in her purpose to 'wait' as before; and she therefore proceeded to enlighten her niece regarding the condition of her uncle's pecuniary difficulties without further ado.

She prefaced her remarks by assuring Beatrice that she had not come to plead Colonel Stardale's cause; she did not want to marry him, and that was an end to it; moreover, it was exceedingly doubtful whether the Colonel would renew his offer now, even though Beatrice did change her mind. However, it was not upon this matter she had intended to speak, but on another infinitely more serious, and touching them all very closely. She and Beatrice had both noticed how silent Angus had lately become, and how worried he often appeared. Well, the truth had come out at last; things in the City were rapidly going from bad to worse, and they were on the verge of ruin. A few weeks might see them turned out of this comfortable house, and buried alive in third-class lodgings somewhere in the East End. Miss Macallan did not mind it so much upon her own account; she was growing old, and it did not matter what became of her; but her heart sank within her when she thought of poor Angus. But there! It would do no good harping on it; the change was inevitable, and must be met with stout hearts. They must show Angus that poverty had no terrors for them, and relieve him of the thought that his misfortunes would destroy their happiness; for that was what preyed upon him more than anything. She would say no more about the matter.

But Beatrice preserved so stubborn a silence that Miss Macallan began to fear she had not spoken with sufficient plainness, and resuming the thread of her discourse, said a great deal more; and by dint of judiciously-worded insinuations and assurances, made Beatrice understand that two courses were open to her, and two only.

What they were, required no great cleverness to comprehend; Beatrice had realised that she stood where two roads met, as soon as her aunt began to paint the trials in store for her uncle.

'I—I will think over it,' she said to her aunt, who showed unmistakable signs of beginning again; and without waiting for any rejoinder, she fled to seek refuge in her room. Once there, she locked herself in, and sank down on the hearth-rug to decide along which path duty lay, and try to muster up courage to follow it.

While Beatrice wrestled with her troubles upstairs, Mr Macallan and his sister were closeted together in the library below: they had been discussing the prospective change in their circumstances, and had come round again to the effect it would have upon their niece.

'I am afraid she thinks we blame her for refusing Colonel Stardale,' remarked Mr Macallan, 'she has been so very silent for the last day or two. I hope you have not been bothering her about it, Elizabeth?'

Miss Macallan drew herself up, and seemed about to reply angrily; but somewhat to her brother's surprise, she answered in tones of confidential reassurance.

'Do you know, Angus,' she said, 'it has more than once crossed my mind since Thursday that Beatrice is already regretting her hasty refusal of the Colonel?'

'I wish I could think you were right,' said the old gentleman earnestly. 'If we could only stave off the crash till she is in safety, I could meet it with a lighter heart.'

'I am certain my idea is correct,' affirmed Miss Macallan; 'but I hardly know what to do. Whether to ask the Colonel to call again, or'—

'Do nothing,' interrupted her brother. 'Bee is as honest as the day; and if she changes her mind, we shall very soon hear of it.'

'One never knows,' murmured Miss Macallan fretfully; 'girls are so strange about these things nowadays.'

'By the way, Elizabeth,' said Angus after a few minutes' pause, 'I almost forgot to tell you. Don't say a word to Beatrice about my monetary embarrassments: she might think we wanted to coerce her into retracting her refusal of Colonel Stardale.'

'Perhaps she might,' mumbled Miss Macallan, feeling rather uncomfortable.

'After all, our aim is to secure her happiness, and a brilliant match is not the way to obtain that for a girl like Bee unless her heart be in it.'

'No,' whispered Miss Macallan, who was growing decidedly nervous.

'So just let her remain in ignorance for the present. If she should wish to recall Colonel Stardale, I won't have it on my conscience that any pressure has brought about her change of mind.'

Miss Macallan could not find words to answer her brother; she stood in great awe of him, and dared not risk revealing that she had just done what he now forbade. She could not undo it, but she could at least conceal it from him; and she went at once in search of Beatrice.

'I have been talking matters over with your uncle,' she began, taking a seat near Beatrice. 'And I have just come up to warn you not to mention his difficulties before him. He is so dreadfully cut up and miserable, particularly on your account, that I want you to be very careful to hide from him the fact that you know anything of the business. It would only add to his distress if he thought you had heard of it sooner than is absolutely necessary.'

Beatrice was too much absorbed with her own trouble to think of weighing the motives which prompted this speech. She promised to bear her aunt's instructions in mind, and avoid saying a word which might betray her knowledge; and relapsed again into the question which absorbed her mind. Should she throw over Ralph Thornleigh and marry Colonel Stardale?

Two days passed, and neither Mr Macallan nor his sister had received any indication of the

state of their niece's feelings. Miss Macallan had not again mentioned Colonel Stardale nor her brother's affairs; but she was waiting with no little impatience for the seed she had so carefully sown to bear fruit. Twenty times a day she was tempted to ask Beatrice what she meant to do, but forbore, reflecting that it might be unwise to display too much anxiety. Had she only known it, her niece had already made up her mind, and was bracing herself to take the step which would commit her past redemption. She found it impossible to condemn her uncle to poverty and disgrace, when it lay in her power to save him; but she put off declaring her resolve from hour to hour, in the desperate hope that something might transpire to save her; whence or in what shape she did not attempt to conjecture. But Miss Macallan's patience was rewarded at last. Beatrice sought a private interview with her uncle, and told him she had been thinking over Colonel Stardale's offer, and had come to the conclusion she had done wrong in refusing him. She liked him very much—a great deal better than any of the others, and it seemed hopeless to go on waiting until Mr Thornleigh could afford to marry. She thought she had better try and forget him and accept the Colonel. What did Uncle Angus think?

Uncle Angus was a good deal surprised at her change of mind, but did not say so. He only told her that such a matter as this was one she must decide entirely for herself. She must not allow anything other people said to influence her for a moment; for he would never countenance her marriage with a man for whom she did not entertain the feeling due a husband from his wife. He would, however, admit quite frankly that if she had brought herself to see Colonel Stardale in a warmer light, he should welcome him as her husband, and sincerely rejoice to see her so well provided for. She had better tell her aunt that she wanted to retract her refusal, and leave her to put the matter straight; he had no shadow of doubt but that the Colonel would be only too glad to learn what Beatrice had just told him.

So Beatrice went up to see Aunt Elizabeth, and Aunt Elizabeth kindly undertook to do what she could. She was going to Lady Bankfield's that afternoon, and was sure to see the Colonel there. She was, beyond expression, delighted that Beatrice had taken a proper and sensible view of the business, and was quite certain she would never regret it. Of course, it was by no means a foregone conclusion that Colonel Stardale would come tamely back at her summons; men had pride, and it would be a very delicate subject to touch on; indeed, she did not see how she could bring it up at all unless he referred to it first. However, Beatrice might rest assured she would do her best.

Of this Beatrice was only too certain: nevertheless, she clung obstinately to the hope that her aunt's mission might fail, and passed the afternoon in awful suspense. When evening drew near she took her station at the drawing-room window to watch for Miss Macallan's return; her heart stopped beating as she saw the old lady coming across the square, for there was unmistakable triumph in her bearing. Aunt Elizabeth had seen the Colonel, and was em-

powered to inform her niece that he would do himself the pleasure of calling at No. 65 next day. He had been most kind; and while Miss Macallan launched forth in paeans of praise, extolling the Colonel's tact and courtesy, which had made a pleasure of her painful task, Beatrice crept away to her own room. She felt that the sun had gone out.

From that hour she entered upon a new and strange existence: she moved and spoke like one in a dream, without interest or feeling. Colonel Stardale came to renew his offer next afternoon, and she was dimly conscious that his manner spared her all sense of awkwardness, and was grateful to him accordingly. She submitted to his stately caresses without revulsion; she was simply acting a part, and he appeared to be doing the same. In truth there was something slightly artificial in the Colonel's style of wooing. There was about it a studied calm; a majestic deliberation; a total absence of unseemly ardour, which had roused Beatrice's keen sense of the ridiculous before, but now made his unwelcome addresses supportable. Colonel Stardale was too sincere an admirer of Colonel Stardale to have much love to spare for any one else. If the principals were undemonstrative, however, their remissness was more than atoned for by Miss Macallan. Colonel Stardale remembered that lady's congratulations with a shudder, to the very last day of his life. When the Colonel led Miss Cairnswood into the drawing-room and said: 'Permit me, Miss Macallan, to beg your felicitations,' she seized both his hands and shook them until the camelia in his button-hole fell on to the floor, emitting alternate sobs and blessings. There could be no doubt of her sincerity; but the Colonel was glad when the ordeal was over.

Mr Macallan's mode of congratulation was much more to his taste, though there was a shade of genuine sadness in it. 'You don't know yet what you have won, sir,' he said simply; 'but I know what I am about to lose.'

The Colonel could not remain to dinner that evening, and Beatrice bade him good-night with something like relief. As soon as he had gone, she went to her room to write to Ralph Thornleigh; and while she wrote, her apathy fell from her; she lived again; she realised her position fully for the first time; but the recovered power to think and feel left her as she sealed her letter, and seemed to depart with it.

The weeks rolled by, and Beatrice heard nothing more of the disaster she had been told hung over the house; her uncle was going about his work in the City as usual, and she was fain to admit to herself that there had been a marked change for the better in his spirits since the date of her engagement; and this was the one gleam of comfort her sacrifice brought her.

Already she was tasting the sweets which would fall to the lot of Mrs Stardale: houses whose doors had been closed to Miss Cairnswood opened wide to the prospective bride of the Colonel, and Miss Macallan, who shared her niece's social progress, was wafted into a realm of mundane bliss which was no preparation for the poverty-stricken trials she professed to anticipate.

Ralph Thornleigh's answer to the letter Beatrice had written him on the day she accepted

Colonel Stardale had only served to strengthen her affection for him. The hardest blow brought out the truest ring. He told her she had done right; that, under the circumstances, she could not have acted otherwise; he knew her too well to believe for a moment that she had thrown him over for the sake of wealth, and his love for her remained unchanged. But this being so, justice to Colonel Stardale required that they should cease to correspond—for the present, at all events. If there had been any wrong, he was to blame for having asked her to wait for him when he saw no reliable prospect of attaining a position which would allow them to marry.

Beatrice had never mentioned Ralph Thornleigh's name to Colonel Stardale, though she told herself daily that she ought in honesty to tell him the truth regarding her sudden change of mind. But she hesitated to make a confession which she thought might reflect upon her uncle's probity. It was impossible to dissociate him from his sister, who had been the real promoter of the business; so she kept her own counsel, and the secret did nothing to enhance the small enjoyment she found in her new life. Matters in the City were at a stand-still in so far as the impending crash was concerned, though, if her aunt had spoken truly, it might be expected to occur any day now.

Colonel Stardale was certainly everything she could have desired, always considerate and attentive, without displaying overmuch affection or appearing to look for it from her. He never allowed a day to pass without coming to Warriston Square; and when Beatrice pled an excuse for declining to drive with him, as she often did, he accepted it unquestioningly with icy calm.

No date had yet been suggested for the wedding, though Miss Macallan exhibited daily increasing eagerness to begin preparations for the great event.

'If you ask my advice,' she was wont to say to her niece, 'I would say, order the trousseau at once, and name the day.'

But Beatrice steadfastly declined to ask for this advice; she refused to order so much as a pocket-handkerchief; and the bare mention of 'the day' roused her from her torpor, and goaded her to the energy of wordy combat, whence Miss Macallan perforce retired beaten.

Then the old lady sounded the Colonel on the subject, and met with no better success. Undignified haste was foreign to Colonel Stardale's temperament, and he baffled Miss Macallan's most persistent representations with his high-minded indifference to detail. His desire, he said, was to study the wishes of his fiancée; any date she considered suitable would be agreeable to himself, provided due notice were given to the world. They might begin to think about it towards the end of the season, perhaps; that was—ah—usually the time when these things took place.

'But the season hasn't even begun!' exclaimed Miss Macallan, now thoroughly alarmed at the bridegroom's bland content with the policy of procrastination, 'and won't begin for a month or more.'

'I am—aware of it,' replied Colonel Stardale with unmoved calm; 'but—ah—Beatrice is not in a hurry; and I am—ah—not in a hurry. At the same time, you, Miss Macallan, have right

to claim some word in the matter. I will gladly leave it to you ladies to decide.'

Thus thrown back on Beatrice, Miss Macallan attacked her again with ominous hints that unless the marriage took place within a month or two, it might never come off at all. Angus would be in the Bankruptcy Court, and'—

'And then?' inquired Beatrice, as her relative paused.

'You know what I mean,' stammered Miss Macallan. 'The Colonel would never allow his wife's relations to be disgraced.'

'I understand you,' replied Beatrice, fixing her clear steady gaze upon her aunt. 'I will ask Uncle Angus whether an early marriage would relieve him from his embarrassments.'

Whereat Miss Macallan gasped in alarm, and subsided into frightened silence. She dared not let her brother know what she had done, and could not acquaint Colonel Stardale with their position until he had actually made Beatrice his wife; but if Messrs Macallan & Son could not keep their heads above water until after the marriage, her plans might prove futile, and poverty be her lot after all. She could not venture to press Beatrice further, and found with dismay that she must resign herself to wait until such time as her niece elected to put an end to her suspense.

A few weeks after the engagement had been made known to the world through the medium of the Society journals, Colonel Stardale took a step which was destined to have an important bearing upon the future. It was nothing in itself: he merely asked Beatrice to accompany him to his own particular man, Mr Gustav Schenks, to be photographed; she did so, and the result was a master-piece of portraiture. Had the Colonel remained satisfied with that, this chronicle had never been written; but some imp of mischief suggested that he should have it copied life-size in oils, and the Colonel adopted the idea on the spot. Such a picture, he thought, would form a graceful addition to the wedding gifts he had already ordered; and by having it painted from the photograph, the matter could be kept secret from Beatrice, who would doubtless appreciate it the more if it came as a surprise.

The first thing to be done was to find an artist. The Colonel numbered among his friends some of the greatest painters of the day; but he knew well that it was all an ordinary mortal's life was worth to ask one of them to paint from a photograph: he might as well ask their services to paint a signboard for a tavern. Moreover, painters of repute are prone to take their own time over commissions, however exalted the rank of their patrons; and this picture must be ready before the wedding day.

Could Mr Schenks help him? The great photographer shook his head; he was much grieved to deny anything to so valued a customer as the Colonel, but such business was quite beyond his sphere. Colonel Stardale was disappointed, thinking, with reason, that inasmuch as he was photographed in Mr Schenks' studio in about nine different attitudes at every change of the moon, that artist ought to stretch a point to oblige him.

Mr Schenks did reconsider the matter when it was laid before him in this light, and undertook

to make inquiries about a painter to whom the commission might be entrusted. His diligence was crowned with success: a couple of days later he wrote to say that he had obtained the name and address of a young artist who did work of this description, and who would gladly undertake the Colonel's order on moderate terms. His address was No. 210 Wenside Street, Holborn, and his name was Ralph Thornleigh.

THE CALENDARS.

FROM the most casual glance at a planisphere or celestial globe one is led to associate the noble and sublime science of astronomy with shepherd life. In the pastures of the newly-created world the first human beings had very little society, and all they saw from day to day was their flocks grazing and frisking about them. There were several signs, however, by means of which, if they were only observant, they could have roughly calculated the flight of time. Thus the departure of the birds in the autumn and the fall of the leaves warned them of the approach of winter, and fixed an epoch recurring with periodic regularity. But in their wanderings in search of new pastures, the necessity of an unerring guide became of paramount importance, and naturally the heavenly bodies came to be adopted as a great compass or wondrous directing and date-marking machine, fixing the regular periodic flow of time. Thus the heliacal rising of one certain star heralded the advent of the shearing season, while the appearance of the Pleiades in the east preluded the seedtime; and thus two dates of the utmost importance to a primitive and pastoral people came to be fixed. And as in this simple astronomy the shepherds traced the annals of the stars among their flocks and herds, so in like manner they traced the history of their flocks among the stars.

Thus the course of the sun came to lie amid sheepfolds and their surroundings. At one time of the year the zodiacal constellation Taurus, the bull, the lord of the herd, marked where 'the father of day' was located. At another time the Ram, the master of the fold, served to designate his position.

The lion, the terror of herdsmen, was also placed in the sky, together with the dreaded scorpion; and besides these concomitants of the life of a shepherd, he placed likewise above him still dearer associations, such as the children of his household, Gemini; the virgin, Virgo; the ear of corn, Spica Virginis; and his instruments of husbandry, the Plough and the Sickle.

The best possible proof of how far the stars had entered into the life of man may be found in the worship of the Sabæans of antiquity, who adored the starry hosts as Infinite God. But this epoch of mystery evidently preceded the dawn of observation, and the most important period in connection with the subject of time-measuring commenced when men began to turn the celestial

sphere into a mighty rustic habitation, modelled on the basis of their own immediate surroundings.

Even the dog, the type of watchfulness, was translated to the heavens; the bright star Sirius, whose heliacal rising in the days of ancient Egypt presaged the overflowing of the Nile, a periodic event of the greatest national importance.

Thus, from the earliest times the heavenly bodies in their seasons have been regarded as grand time-measurers; but long before the stars had been observed for astrological or other purposes, the sun and moon more intimately connected with man's existence came to be regarded as time-marking machines; and it is on the motions of these two celestial bodies that all Calendars have been based.

It would be reasonably expected that the sun, which is the great source and supporter of life upon the earth, and the regulator of the seasons, would be generally adopted as a measurer of time; but men were also struck by the constant and regular return of the phases of the moon, and from this fact they were led to use the moon as the basis for their calendar.

The Mussulman year is purely lunar, and consists of the period embraced by twelve revolutions of the moon around the earth, or three hundred and fifty-four and one-third days. The Israelites never adopted the solar year, not even when they lived so long in the land of Egypt, for we find them, so soon as they were settled in the Promised Land, using the lunar month and the lunar year. The ancient Jewish year had only three hundred and fifty-four days; twelve days were added sometimes at the end of the year, and sometimes a month of thirty days after the month Adar, in order to bring it into agreement with the solar year. But the Jewish calendar received a reform in the fourth century after the Christian era, and it is this improved calendar which is used by the Jews of our day for fixing their festivals and religious ceremonies. It is extremely ingenious, and is based on the course of the moon. The year is composed of twelve lunar months when common, and of thirteen lunar months when embolismic; and these years succeed each other in such a way that after a period of nineteen years the commencement of the Jewish year arrives at the same epoch as the solar year. The Jewish year is therefore a lunar-solar year; and the civil year of this remarkable people, in common with all Oriental nations, commences with the new moon of September, and the ecclesiastical year at the new moon in March.

The Egyptians, who reached a high state of civilisation in the dim twilight of remote antiquity, calculated the year as consisting of three hundred and sixty days, or twelve months of thirty days. In the pursuit of astrology—that vain attempt to evolve the secret of the supposed mystic connection between the celestial bodies and the destiny of man—the Egyptians were unconsciously laying the groundwork of the sublime science of astronomy; and in a period of continued observation they found that the year of three hundred and sixty days fell short of a true solar year by five days. This new year came into force and commenced on the 26th of February 747 B.C., and this day was the

beginning of the era of Nabonassar. The year of three hundred and sixty-five days was followed for a period of seven hundred and twenty-three years; but in the year 25 B.C. a supplementary day was added every four years, and this year of three hundred and sixty-five and one-fourth days became a fixed year, and was adopted by the Romans when they conquered Egypt. This year was also adopted by the Copts, and the first year of the era of the martyrs commenced on the 29th of August 284 A.D.

The Greeks, the most cultured of the nations of antiquity, were rather slow to turn their powers of observation to the sky. They employed at first—borrowing from the Egyptians and the Babylonians—the year of three hundred and sixty days, divided into twelve months of thirty days. Each month consisted of three decades; and this is the sole example in ancient history of a week of ten days. Meton of Athens in 432 B.C., having observed the summer solstice, found that a period of nineteen solar years contained two hundred and thirty-five lunations exactly, and that at the end of this period the sun and the moon returned to the same point in the heavens. This discovery was considered so important, that an account of it was carved in letters of gold upon the temple of Minerva, and hence the origin of what is generally known as the Golden Number. For the purposes of chronology, the Greeks counted the years by means of Olympiads; the first Olympiad occurred 776 B.C., and the last in the year 440 of the Christian era.

The Roman year, as instituted by Numa and regulated by the moon, consisted of three hundred and fifty-five days, divided into twelve months of unequal length. But this year of three hundred and fifty-five days did not correspond to the periodic return of the seasons, and in the time of Julius Cæsar the Roman calendar had fallen into great disorder. To correct this confusion, Cæsar sought the assistance of Sosigenes, a distinguished astronomer of Alexandria; and it was decided that the civil year should consist of three hundred and sixty-five days, six hours—in other words, that there should be three consecutive years of three hundred and sixty-five days, and that the fourth should contain three hundred and sixty-six days, the extra day being intercalated between the 23d and the 24th of February; and as the 24th was the *sexto calendas*—six days prior to the 1st of March inclusive—the additional day was called *bis-sexto-calendas*; hence the origin of our word *bissextile*. This change took place in the year 44 B.C.; and to correct the disorders in the calendar, it was necessary that the previous year should consist of four hundred and forty-five days. The Julian year is still actually followed by the Russians, Greeks, and some Oriental Christians.

The year as fixed by Julius Cæsar being fully eleven minutes longer than the true solar year, another change was made in the year 1582, when Pope Gregory XIII. ordered that Thursday the 4th of October 1582 should be followed by Friday the 15th of October. This, as it has been called, the *New Style*, was not adopted in England till the year 1752. The quarter days are Christmas, Lady Day, Midsummer, and Michaelmas; so, when the *New Style* came into operation, these

days were advanced, so to speak, eleven days, and thus became the 5th of January, April, and July, and the 10th of October—most important days in connection with Stock and Annuity business.

RUBE THE RATCATCHER.

It is milking-time at Hayling's Farm. In the warm, quiet, sunny atmosphere you can hear distinctly the tinkling of the milk as it falls into the pails, and the clink of the buckets as the milkers every now and then get up and go to a fresh cow. The warm afternoon sun is shining in at the cowhouse door, and the cows are standing peacefully flicking their tails, to keep off the intrusive flies that come in and settle on them. Every now and then the cart-horses move in the stable, rattling their head-pieces as they pull the hay out of the racks above their heads. Up by the farmhouse the two sheepdogs that are chained across the path to keep away tramps are lying flat out on its sun-warmed stones. On the roof of the granary, pigeons of every colour are bowing and strutting—blue rocks the colour of the bloom on a plum; white fantails arching their necks and spreading their tails; red ones with the shifting colours on their necks turning from green to purple, from purple to blue, with every turn of their heads in the sun. They fill the air with their low monotonous cooing—a peaceful sound on a hot summer's afternoon. As they all fly down past the kitchen window, presently the sun on the fantails' white feathers is so dazzling that they flash a bright reflection into the room; they settle on the path, and begin to peck about.

By-and-by a cart drawn by a bony old white horse comes rattling down the lane and stops at the farm-gate, and a man gets out and enters the farmyard. The old horse immediately goes off to the hedge and begins to munch the long grass in it. Inside the cart is a disreputable-looking terrier, with one eye closed up from a swelling over it where a rat has caught him. He sits up in the cart with his head rather on one side, and one ragged ear cocked, listening to the barking of the two sheepdogs, that had woke up from their slumbers directly the cart stopped, and are now dancing round on the ends of their chains, barking furiously at the man as he comes through the farmyard and up the little path. He pauses when he reaches them; then, seeing that they cannot get quite across the path, slips past them, and goes up to the door. The pigeons fly up with a brilliant flash of colours as he does so. He is a thin, middle-sized man, with pale red hair, and light eyelashes, under which his eyes, that are much the darkest thing about him, have a curious, shifty, humorous expression. He is clad in ragged whity-brown clothes, that give him the appearance of a very untidily-tied-up brown-paper parcel. He taps gently with his knuckles on the door—a tap that is as furtive as his face—then turns round and looks down the path and at the two long narrow borders on either side of it, in which lilies, cabbage-roses, bachelor's buttonholes, lavender, lad's love, and white pinks, are mingling their gay colours and filling the air with fragrance. Then he shuffles with his feet, and makes faces at the two dogs, that are still

straining at their chains and barking, making them more furious than ever. No notice being taken of his tap, he knocks again, this time a little louder; then, as still no one comes, he goes and looks under the flapping butter-cloth that hangs over the dairy window to keep out the sun and dust.

The dairy looks deliciously cool this hot afternoon with its fresh whitewashed walls and damp stone floor, over which buckets of icy-cold water from the deep well outside are thrown constantly, to keep the air cool. In one corner stands a quantity of cream jars of all shapes and sizes, some of pale rough red pottery, others of rich shiny red brown with pale yellow linings. On the shelf of deal, white with constant scrubbing, that runs round the dairy, stand great primrose-coloured milkpans, filled with milk; and one shelf is covered with pots of fresh deep yellow butter ready for to-morrow's market. The very sight of such a dairy carries one's thoughts away to the low-lying meadows, where the cows are standing knee-deep in the long grasses, on which the white clouds throw swift shadows as they pass, and every breeze that blows by takes away with it a warm milky fragrance; where the swallows are flying low, and the only sounds are the cows' deep sighs of contentment and quick cropping of the sweet dewy pasture. The sight of the yellow butter in conjunction with a smell of hot cake that is issuing from the kitchen apparently, from the expression of his face, suggests to Rube the ratcatcher that he is very hungry, and he drops the corner of the butter-cloth and turns away again. Then he goes and looks through the lattice window into the kitchen. The stone floor has evidently just been freshly whitened and the hearth swept; the kettle is boiling away briskly; but the room is quite unoccupied, save for a great black cat that is sitting blinking dreamily at the red coals.

Going back to the door, Rube begins to knock on it in good earnest; when it is pulled open from the inside and the mistress of the farm confronts him. 'Gracious! Rube, have you never been kept waiting before a moment, that you put yourself into such a flying stare. I declare you made noise enough to wake the dead!'

Rube looks at her with a sly twinkle under his flickering eyelashes. 'I knocked and I knocked,' he says, touching his hat and bobbing at every other word, 'and I got quite anxious. I did zay I thought zummat must hae bin the matter with you, and I was just agwine to call out'—

'None of your nonsense, Rube; you knocked three times, for I heard you.'

Rube only grins imperturbably.

'Well, what do you want?'

'I yeard as you've a ter'ble lot o' ratses about, and I come to zee if you'd like vur me to come over with my doags and fer'ts one day.'

'Well, they are a nuisance. They rob my hens' nests and carry off my young chickens. I don't know but that 'twould be as well for you to come. I'll think about it, and let you know.'

'Better make up your mind at once, ma'am,' says Rube persuasively. 'I've a rare handy farrier; I'll want he will polish 'em off. I've bin up along to Farmer Abel's all the afternoon, and he killed three dozen in a hour.'

'Now, don't you try to gammon me, Rube; I've known your yarns too long.'

Rube passes this by as though he does not hear. 'It be ter'ble dry work, rattin' be,' he says reflectively, looking past Mrs Hills, and fixing his eyes on the key of the beer, which hangs on a hook on the dresser.

'Ah!' says Mrs Hills pointedly, 'you finds it so, if all the tales one hears be true.'

'Don't you believe all the tales you years, ma'am,' replies Rube, unabashed. 'Zome volks be that primed with spiteful tales about their neighbours, as they'd bust if they didn't let zome o' 'em out.'

At this moment, Joseph, the milkman, comes up the little path with a bucket of warm foaming milk in each hand. He is a tall old man, with a long shrewd weather-beaten face. He looks sharply at Rube as he passes into the dairy, where he begins pouring the milk into the pans, keeping his ears well open to the conversation outside. Mrs Hills is just fixing a day, when her attention is caught by a loud whisper behind her of 'Missus!' She looks round to see Joseph contorting his face into the most extraordinary grimaces. He beckons to her with a long forefinger, keeping well out of Rube's sight.

'Whatever's the matter, Joseph?' asks Mrs Hills, going up to him.

'Don't you hev that 'ere Rube, Mis' Hills,' he whispers, still grimacing and nodding his head; 'he puts down more ratses than ever he kill, I'll warrant he do.'

'What do you mean, Joseph?'

But Joseph only winks solemnly, wags his head, points at the door, and lays his finger on his lips.

Rube, outside, is vainly endeavouring to catch what is being said; there is something the same expression on his face as that of the cock-eared terrier in the cart.

'Rube! Now I think of it,' says Mrs Hills, coming out to the door again, 'I can't have you, after all; your dogs would make such a rout with the fowls; and I never could bear ferrets—nasty crawly things. You might let one of 'em go, and I should never be able to sleep abed again.'

Rube made a pretty shrewd guess as to Joseph's share in this sudden dislike to ferrets; but he took it very coolly; he touched his hat to Mrs Hills; gave Joseph, who had come out again with his clinking pails, a calm wink, and walked off.

'What did you mean, Joseph?' asked Mrs Hills, watching him.

'Why, it be like this yere. T'other day he went over to Farmer Hollis's rattin', and he zhuts hisself into the barn wif all his doags and fer'ts. "Wait a bit," zays he, "and I'll zoon get 'em out," zays he; and he zhuts to the barn-doors. Wull, arter a minute or two, Muster Hollis years a gurt n'ise gwin' on inzide, him a hollerin' "Hilloo! Hilloo!" like mad; and he goes and look drough the air-hole into the barn, and then he zees the whole chap a-pullin' the ratses out o' his pockets and drowin' 'em down and shoutin' out "Hilloo! Hilloo! Hilloo!" like as though they was a-comin' out o' the walls, and he was a-zettin' the doags at 'em!'

In the meantime Rube had gone out through the farm-gate into the road again, where he found the old horse had eaten a great patch clear in the

hedge. After he had turned the horse round, he got into the cart and rattled up the lane again. As he drove along, the rackety old cart swaying from side to side, and the old horse stepping out with such high action that his knees were nearly as high as his long Roman nose, every one he met had a nod or word for him. 'Well, Rube, how be the world agwine with you?' called one man as he passed.

'Oh! shall soon hae enough to retire on the Continong!' replied Rube airily.

Rube the ratcatcher had begun life as a doctor's coachman; but his career in that capacity had been soon cut short through his incorrigible laziness. After that, he took to doing odd work; then he married a widow from the workhouse with six children—'to better hisself,' he said—on which occasion he had come out gorgeously attired in a blue coat with brass buttons, and light gray trousers, that he had borrowed from a young farmer for whom he worked, as he wished to 'look like a gennelman for once in 's life.' The marriage turned out a very happy one; and they managed to keep their heads above water somehow, she by taking in washing; and he by ratting, clipping horses, driving pigs, and hiring out the old horse, which he supported by begging a little hay or straw here and there at the farms round, cutting grass from the hedges, or tearing it out on pieces of waste ground, while he sat in the hedge, generally accompanied by half-a-dozen children, smoking his pipe, and keeping guard over it—an occupation that just suited him. Each season in turn gives something, for he knows the sunny copse, or sheltered bank of the silently stealing watercourse, where the first primroses come out; and later, when they are plentiful, where to search among the nettles and moist dead leaves of last year for the dewy white violets and their pale blue sisters. Again, when every country lad has a bunch of them in his cap, he leaves them to gather the slender-stemmed cowslips and the bluebells. He knows, too, the tangled copse where the first marsh marigolds blow, glowing like cups of purest gold above the peaty waters of the brook, as it glides slowly along under the brambles. And now his flower-harvest is nearly over, for everywhere there is a faint scent of flowers opening. The amber-cinctured bees are busy the livelong day; the milk-white cuckoo-flowers are pushing up to greet their namesake; the spotted-leaved orchis-flower stands tall amongst the grass; the buttercups are so thick that the meadows look shot with gold; and the dwellers in the little market-town where Rube sells his flowers can fill their hands as full as they list in the course of a country evening stroll.

By-and-by come the mushrooms, and Rube wanders for miles over the downs searching for them carefully, avoiding the 'fairy rings' as he does so, for he is deeply superstitious, and fancies that any one who steps into a fairy ring passes under the influence of the fairies. There is a spot on a particularly lonely and bleak part of these downs around which is some dark story. It is very far back, and nobody knows exactly what it is; but there are vague tales of sights seen there and sounds heard. The Deadman's Ridge it is always called; for it is a mound rising suddenly, covered at the top with a great patch of weeds. The country-folks associate these weeds with the

story; for 'If you buries a pig or a hoss in a vield, doan't nettles and weeds come as thick as can be; and so 'twould be wi' a man,' they say.

The foot of man is hardly ever heard there, for the shepherds shun it, and not even a poacher will come, for it is lonely enough by day; and it must be dreadfully so by night, when the moon is silvering the downs, and the wind-blown trees and tall weeds are throwing wavering, mysterious shadows. Only the bat flits over it, or the owl glides by, showing dimly through the gloom; or, by day, the swallow skims past; or a sheep, straying from the flock, stops to nibble for a moment at the long rank herbage, then goes bleating off again. And in winter, when the wind is driving up icy from the snow-fields it has blown over, sweeping the desolate downlands, and sending a shower of snow-flakes in front of it, or whirling up a few dead leaves, its loneliness will remain unbroken for days at a time, save when sometimes a seagull will float by, coming inland from where the sea heaves dark and sullen.

About this spot Rube has one of his favourite stories. 'I was gwine athart the Deadman's Ridge, a-musherrooming, one day, when I zeed a gurt white hoss come a-gallopin' along the down wi' fire blowin' out vrom 's nose and 's hoofs like as though they 'd just a come off o' John Saunders' anvil, and scritchling like as though he 'd a got summut ter'ble the matter wi' un. And when I zeed un, I vell on my vace as vlat as a Chale Bay mackerel; and when I gets up again, there warn't nothin' to be zeen, only the grass looked zort of zinged like.'

On wintry nights, when Rube tells this tale, leaning out of the dark chimney corner of the *Golden Lion*, the firelight lighting up his curious white face, and the pupils of his eyes dilating like a cat's, there is always a scroop of chairs moving on the stone floor, as every one hitches his a little nearer, with an uncomfortable remembrance of the long lonely walk home he will have under the gloom of great elm-trees, past bleak waste grounds, or ghostly cross-roads. And when a move is begun, there are always a good many remarks, such as, 'Be you a-comin' wi' me, Bill?' or, 'I med just zo well come wi' you, Harry;' and no one has ever been known to accept Rube's challenge of, 'Wull, now, I'll be bothered if I wun't go up over now and zee if I can't zee nothin', if an one o' you wull come wi' me'—with which he always ends his story, whereby he has earned a cheap character for intrepidity. There are one or two sceptics, however, who profess not to believe a word of the whole story, averring that they believe that all Rube saw was Farmer Rook's old white horse, and that he got the whole thing up on purpose to scare people from going to get mushrooms there; which I think myself is quite within the bounds of probability.

When the blue haze of autumn lies over the distance, and the sun, that has lost its summer heat and brilliancy, steepes everything in a mellow light, he saunters along by the hedges, a big basket on his arm, blackberrying. Every now and then he will put one in his mouth, closing one eye as he does so with the air of a connoisseur tasting a glass of rare wine.

Amongst his many failings, Rube possesses the rare virtue of a contented spirit. Wherever you meet him, whether sauntering over the downs on

a balmy evening, or ratting in a bleak field, with a bitter wind driving a cold sheet of rain in his face; whether paddling with bare feet up the stream for cresses on a raw autumn day, or lying dozing in a hedge in the warm summer sun—his face always wears the same expression of humorous happy-go-lucky contentment. 'It baint money nor good vittals as makes folks happy,' Rube often observes; 'vur I've a zeen amany as hae got all, they lookin' as zure as a dead mouse in a sink-hole; it be the right way o' lookin' at things. Now, I don't believe as there be anythin' in the world as I wants myself, except'—very insinuatingly—'as you'd hae a bottle o' my embrocation!' For Rube is an inventor in his way. Besides the embrocation, he has invented a rat-trap that will never work, and a mole-trap that is equally unsuccessful, though he himself will volubly assure you that 'nothin' ever worked pertier than they does;' and not long ago he appeared at Hayling's Farm with an account of a wonderful rat poison he had invented. 'Tis the most wunnerful ever you zee, ma'am! I'll warnt it is! Only vive shillen the bottle! And wull kill every rat in the place; and no cat nor dog wun't touch it, nor no fowls; but the ratses wull eat it up zo greedy; and it kills 'em off afore they can zay Hullo! You zay the word, ma'am, and I'll bring you up zome, only vive shillen the bottle!'

'Very well, Rube; you bring a bottle, and put it down; and as soon as I see the rats dead, I'll pay you.'

'Ah! But wun't zee 'em; they 'll hae crawled away to their holeses.'

'But you say they die so quick; and if nothing else won't eat it, you can put it down in the middle of the rickust, or anywhere else away from their holes.'

A slight change came over Rube's face. 'Vurry well, ma'am, I'll bring un,' he replied cheerfully; but though he has been to the farm on fifty different errands since, he has never yet brought that bottle of rat poison.

UNSUSPECTED DANGERS.

As if there were not already sufficient ills that flesh is heir to, quite a rage for discovering new ones appears to have set in, despite Shakespeare's excellent advice that we should

Rather bear those ills we have,
Than fly to others that we know not of.

Were we to heed all that is written in these days of ultra-scientific research on what we have termed Unsuspected Dangers, we should live in a state of constant dread, and existence would become intolerable.

We have always considered walking to be one of the healthiest forms of exercise, but it appears, from a theory lately started by a French army doctor named Colin, that the shock caused by the heel of the boot striking the ground is extremely bad for the nervous system. Dr Colin, who has been making extensive experiments, declares that this constant jar, slight as it is, has in time a prejudicial effect on the spine and brain; and to this is due a great part of the feeling of fatigue after long walks. Especially is this the case

with soldiers, who have considerable weight in arms and accoutrements to carry. In a day's march of about twenty-one miles this shock is repeated about forty thousand times, and to this Dr Colin ascribes the frequent headaches suffered by the men after long marches. As a means of prevention the doctor proposes india-rubber heels.

This news is bad enough for man; but poor woman has an additional cause for uneasiness, arising from the very ground on which she treads—the dust, mud, and other accumulations on pavements having been proved from recent investigation to contain bacilli of the most dangerous character. As if this were not sufficiently terrifying, a Viennese doctor has lately been experimenting with some grapes which he bought. After rinsing the dust from the grapes in pure spring water, he found the water very dirty. As an experiment he injected some of this water into three guinea-pigs. One died in two days of peritonitis; the other two also died after a lapse of over a month. On examination, the bodies showed pronounced tuberculosis originating in the site of inoculation.

Man, however, comes in for his share, since an American chemist has discovered that there is death not only in the pot but in the pot-hat, and threatens us with lead-poisoning from the 'sweat-band,' as the glossy white leather lining which goes against the forehead is accurately if not euphoniously termed. This truth is endorsed by the statement of Dr James Startin of Harley Street, who promulgates the warning that eczema on men's foreheads is often caused by their wearing hats the linings of which have been whitened and glazed with arsenic and other irritating substances. He recommends that the lining should be of silk or some soft undyed material. The discovery by Dr J. F. Geisler, the American chemist above mentioned, according to the *British Medical Journal*, came about in this wise. He bought a tall hat in New York, which there is termed a 'stove-pipe,' and which caused him more than the average amount of discomfort. One day the hat was accidentally exposed to an atmosphere containing sulphuretted hydrogen, and a discoloration of the sweat-band was noticed, which on examination was found to be due to the formation of sulphide of lead. Careful analysis of the band showed it to contain no less than 0.8585 grain of lead per square inch, or 37.548 grains for the whole band.

Nor are the children free, since it has been remarked that the wearing by them of red stockings coincides with pustular eruptions on their legs and feet. The Board of Health in Paris employed M. Schutzenberger, a chemical expert, to ascertain whether the dyes colouring the stockings contained poisonous matter. In his Report he says that all the many specimens submitted to him derived their red colour from matters obtained from aniline and containing a large proportion of antimoniatic oxide. As children perspire freely, this matter enters into solution, and is thus taken into the pores. The Professor had no doubt that it was the cause of the pustular rash which accompanies the use of red stockings. The Board of Health thereupon reported in favour of the interdiction for wearing apparel of dyes obtained from metallic prepara-

tions. That this, at all events, is no cry of 'Wolf' was proved by the sad case of Mr Cronin, chief of the town police in Pretoria, South Africa, who in June last year was laid up with fever and a swelling that commenced with the feet and ankles, extended over the whole body till his eyes were nearly closed, the result, according to local medical opinion, of poisoning from coloured socks.

Another note of warning is sounded from South Africa to ladies who are given over to an inordinate love of bangles. Last January a Kaffir girl presented herself at Grey's Hospital, King-williamstown, desiring that her arm should be amputated. It appeared that the bangles which she wore had so compressed the flesh as to produce extreme inflammation, and it became absolutely necessary that the arm should be amputated. The operation was successfully performed by Drs Blaine and Brownlee, and the patient will now no more wear ornaments on that arm at least. To such an extent will fashion, even amongst the dusky savages, enslave the fair sex.

The danger through arsenical poisoning in our homes is not confined to the wall-papers, having been found often present in cretonnes and imitation Indian muslin in poisonous quantities. A bad specimen of cretonne has yielded on analysis nineteen and a half grains of white arsenic, two and a half grains having been known to be a fatal dose. Some months back a London doctor experimented upon forty-four samples of cretonne supplied by a local tradesman, not one of which was absolutely free from the poison; eleven of them were grouped by the analyst as 'very bad,' and nine as 'distinctly dangerous.' It is quite a common occurrence to have pieces of these substances in a room containing sufficient arsenic to give one hundred people a fatal dose. A very popular impression has been that greens and blues are the dangerous colours, but the analyst declares that reds, browns, and blacks are more dangerous still. With relation to this matter, the following letter on arsenical poisoning through green candles was contributed to the *Times* in March 1889 by Major Leadbetter, Chief Constable of Denbighshire, and cannot be too widely published:

'A curious case came under my notice lately which, I think, is of public value. A children's party and Christmas tree resulted in most of the little people, and many of the older ones, being seized with symptoms of mineral poisoning. The fact of several who were present who had not partaken of food or liquid of any kind being in the number of those affected directed my attention to the coloured candles on the tree. These I had examined by the county analyst, Mr Lowe, of Chester, whose report is to the effect that the green candles were coloured with arsenical green, to the extent that every eight candles would contain one grain of arsenious anhydride. He further reports that the red candles were coloured with vermilion. There is no doubt, therefore, that we had not farther to seek for an explanation of the symptoms—a crowded room, with the atmosphere charged with arsenical and mercurial fumes sufficiently accounting for it. It is only fair to state that I learn the candles were not of English manufacture, and were bought with the toys.'

A common cause of blood-poisoning was recently quoted by a doctor at one of the Berlin hospitals, to which institution a seamstress was admitted suffering from blood-poisoning, caused by using a common metal thimble, when she had a slight scratch on her finger. On examination, the thimble was found to have two or three small spots of verdigris inside. Commenting on this, the *Lancet* says: 'Steel thimbles are much safer, and cost very little. Another variety in common use is enamelled within, and is, if possible, freer from objection. Let us not forget to add a caution that cuts or scratches on the hand should never be neglected by sewing-women as long as dyes continue to be used in cloth manufacture.'

The foregoing are far from exhausting the stock of such recent disclosures: the drinking of tea is said to have an injurious effect upon the complexion, by darkening the skin and causing pimples; but what is perhaps the unkindest cut of all, a Berlin scientific gentleman informs us that danger lurks in a kiss. He has counted and classified the bacteria which lodge in the human mouth—some twenty-two distinct species. His conclusion is that persons who cannot abstain from so dangerous a habit as kissing should indulge in it through the medium of a respirator!

To know what we are ignorant of has always been deemed one of the chief pleasures arising from the study of the sciences, and if from time to time unpleasant truths be discovered, as they must be, it is a moot-question whether their publication is in every case beneficial or necessary; and though it is well to be forewarned, there are cases in which 'where ignorance is bliss 'tis folly to be wise.'

AN EVENING MUSING.

THE witching scents of thorn and orchard-blooms
Come blended on the soft cool airs that pass;
Around my ears the fitful beetle booms,
And faintly lies the shadow on the grass.

The tree, transfigured by the parting rays,
Throws out the colours of the radiant bow;
And o'er the heath-clad hills a glowing blaze
Doth added glory to the heights bestow.

Lo! in the west the golden-coloured isles
Of fleecy cloudlets seem to lie and dream;
The gazer looks with pleasure o'er the miles
So tiring in the early fervent beam.

The night-moths wander from the snow-white sprays
With aimless course; and joyous fly and flit
Along the borders of the garden ways
Through odours thick where crocus-lamps are lit.

Sweet scents, sweet sights of pensive eventide,
We hail your reign, an earnest of that Shore
Where Love shall welcome those with sorrow tried,
And where the mourner shall not sorrow more.

SPILT MILK.

A GOOD deal of plain common-sense is to be found in some of the homeliest of our proverbs; while others, that are far more elegantly worded, often fall very far short of the truth. They may sound well; but strip off the tinsel of the well-turned expressions, and very little of the real ore will be discovered lurking underneath. 'There's no good crying over spilt milk;' and yet, though the futility of the proceeding is universally believed in theory, how very seldom does the practice coincide with the belief! We spill our pails of milk over and over again, and, what is worse, we waste precious time in shedding idle tears over our loss! How wise were these old Egyptians, if, as runs the legend, they magnified the indulgence of regret into one of the deadly sins, a feeling to be fought against and sternly repressed.

As this century rushes to its close, our lives are becoming more and more crowded; fresh interests, wider fields of knowledge, new questions have arisen in this our age to occupy our minds and thoughts. Life's little day is all too short for the multifarious daily toils, joys, sorrows, matters of business, affairs of our own, and others, and minor details which fill it to overflowing; and it is certainly too brief to allow us to sit with folded hands and tearful eyes brooding over the grave of bitter memories and a dead past. As a great writer has so truly said: 'Life is so far like the chase that it admits of but little leisure for hesitation, none whatever for regret. How should we ever get to the finish, if we must needs stop to pick up the fallen or to mourn for the dead?'

Our dear ones are taken from us; the King of Terrors lays his icy finger on their brow, and with them seems to vanish also the sunshine from our lives. Earth's beauty and the countless charms of Nature only mock our bitter suffering, the flowers lose their fragrance, the zest of living goes from us, and grief casts its gloomy shadow on our path. In spite of all this, however, it

will bring us no alleviation to encourage this state of things to continue; we must make an effort—a violent one, if needs be—to emerge from the darkness which at present threatens to obscure our whole horizon, for we cannot spend the rest of our lives in the gray twilight of a gentle sorrow. All the ardent, hopeless longing which fills our breasts, all the tears that were ever shed, will not bring back to us those we have loved and lost; and all that we *can* do is to shoulder manfully the burden laid upon us, rise up and face our trouble, and strive to win resignation, if not forgetfulness, by taking up and doing bravely our appointed work in the world.

It is not, however, only the loss of our nearest and dearest by death which brings into our lives the element of regret. There are the countless misunderstandings, the thoughts and words of bitterness and anger, which are always intensified in proportion to our love for the offender. We say or do something which no amount of after-repentance is capable of undoing, and it may be that a few words can have the power to change the whole current of our existence, and leave behind them a poisoned sting for which there is no antidote. Most disastrous and unforeseen effects sometimes result from thus yielding to the mistaken impulse of the moment, and then—in sackcloth and ashes we regret those hasty words or rash actions which may have ruined two lives, and destroyed not only our own chances of happiness but another's as well. It is in these cases that the practical advice of the friendly proverb should force itself into the midst of our useless self-reproaches and sad reflections.

The milk is spilt, true enough, and by reason of our own carelessness, if nothing worse, but what good will it do us to cry over it? On the contrary, let its remembrance prove as a beacon in our path to warn us against similar dangers, so that the next time we see the frail barque of our Happiness about to dash itself to pieces against the rocks, we may be able to bring it

to a place of safety by the aid of the anchor of past experience and common-sense. There was that investment you thought so promising and secure, but which your friends warned you was unreliable and risky. The people who listen to and act upon the advice they ask for are in a small minority; so you walked unheeding into the pitfall prepared for you, and—the result fully justified your counsellor's warnings. *That* pail was overturned, and your money gone beyond recall, but tears will not help you in this case either!

Perhaps some of the most useless hours ever spent by man or woman are those which are wasted in vain regrets for that which 'might have been.' These are words to conjure with, and imagination is too apt to invest that particular form of happiness which has evaded our eager grasp with a radiancy and a glory which probably it would not in reality have possessed. The deprivation of delights that have been tasted can by some natures be borne to a certain extent with equanimity; but man, or woman either, can seldom think with calm philosophical resignation of joys which might have been their portion had affairs turned out or been arranged differently. There is scope there for all the idealisation of which our minds are capable; the picture of what 'might have been' shines before our enraptured gaze, surrounded by a rose-coloured halo; and in proportion as we exaggerate to ourselves its charms and attractions, we are filled with disgust at our present mode of life.

There are times in the lives of almost every one when the beaten pathway diverges into two or more different turnings, and the question arises as to which shall be traversed. There is a pause in the daily routine of existence; a crisis of some kind has been arrived at, and for good or ill our decision must be made. Shall we turn down this shady lane, filled with the scent of violets, and wander by the side of the limpid brook, babbling sweet music between mossy banks? Or shall we choose by preference the dusty, sun-scorched road, dry and monotonous, which stretches its interminable length before us? Or, again, shall we cross those low-lying meadows to the right, and having climbed the numerous stiles and obstacles which bar our path, seek the inviting coolness of the green woods beyond? Whichever course we decide on, we must abide by our decision; and then, it usually follows that our errant fancy leads us into wild imaginings as to what would have been our lot had our steps led us in another direction. It is the unattainable, the flower which grows just beyond our reach, the happiness which is not ours, and never can be, which possesses such a charm for the majority of human beings. Our choice has been made, however, and it is too late now for idle regrets; so, if we are wise, we will try to console ourselves like the fox in the fable, and say that perhaps, after all, the other paths might not have proved so charming as we imagined them, and that 'all is for the best, in the best of all possible worlds!'

In some cases the pail of milk takes the form of failure, either in one particular undertaking upon whose success we have set our hearts, or in a series of petty disappointments which sap

our vital energy, and threaten eventually to overshadow our lives. What can be more bitter than the conviction of failure to a man whose ambition has soared high as the eagle, and descended with the rapidity of a rocket? The dreams of his boyhood, the hard work and never-tiring activity of his later years, his eager efforts to attain the object of his hopes, be it the laurel wreath, the golden crown, a scheme of scientific importance, or what you will—all is wasted, and he feels inclined to say with Balzac, when the world went so awry with him, and even his brilliant genius availed him nothing: '*Hélas, c'est une vie manquée!*'

It has sometimes happened, though, that failure has led to after-success, and perseverance and dogged persistency have reached the winning-post in triumph, while faint-heartedness and despondency have fallen out of the race.

Besides the causes for regret which we have already mentioned, there are the constantly recurring pin-pricks of daily life, which are sometimes harder to bear patiently than a great sorrow demanding an heroic effort. We are always upsetting our milk-pails, and then sitting down to cry, instead of making the best of it. We make mistakes—who is there that does not? We lose opportunities either for our own advancement or for doing good to our friends. We make a fiasco of our business affairs; we enter into arrangements against the advice of others, and which we afterwards repent; we form undesirable intimacies, from which we find it difficult to retire gracefully; we are extravagant, and run into debt—in fact, the number of ways in which we spill our milk is legion; but instead of mending matters, it is only adding to our folly to be for ever bemoaning it. If our regret makes us wiser for the future, well and good; but even then it must not be indulged in to a great extent; and we fear in most cases our tears have not even that excuse, for when they are dried, we usually set to work, repeating the spilling and crying process all over again!

BLOOD ROYAL.*

CHAPTER XIV.—BREAKING IT OFF.

AT Chiddingwick meanwhile, Dick Plantagenet himself had been oddly enough engaged on rather opposite business. When he arrived at the house in the High Street, so long his father's, he found Maud flown, of course, and nobody at home but his mother and little Eleanor. Now, if Maud had been there, being a forcible young person, in spite of her frail frame, she would soon have stirred up Mrs Plantagenet to take her own view of the existing situation. But the widow, always weary with the cares of too large a family for her slender means, and now broken by the suddenness of her husband's death—thus left without Maud's aid, was disposed like Dick himself to take the practical side in this pressing emergency. To her, very naturally, the question of bread-and-cheese for the boys and girls came uppermost in consciousness. And though it was terrible they

* Copyright 1892 in the United States of America by the Cassell Publishing Company.

should have to face that sordid question at such a moment as this, yet that was a painful fate they shared after all with the vast majority of their fellow-creatures, who constantly have to consider practical difficulties of daily bread at the very time when their affections have just been most deeply lacerated. The more Dick talked with his mother, indeed, the more did he feel himself how imperative a duty it was for him to resign his dream, and return home at once, to do what he could for her and his brothers and sisters. He was a Plantagenet, he reflected, and *noblesse oblige*. That motto of his race stood him in good stead on all such occasions. If do it he must, then do it he would. A Plantagenet should not be ashamed of earning his livelihood and supporting his family in any honest way, however distasteful. For no matter what trade he might happen to take up, being a Plantagenet himself, *ipso facto* he ennobled it.

Fired with these sentiments, which, after all, were as proud in their way as Maud's equally strong ones, if not even prouder, Dick went out almost at once to inquire at the *White Horse* about the possibility of his keeping up the rent of the rooms as his father had paid it; for if the scheme was to be worked, no time must be lost over it, so that the lessons might be continuous. He was a capital dancer himself (worse luck!), and a tolerable violinist; and for the matter of that, Maud could help him with the music; though he shrank, to be sure, from the painful idea that the heiress of the Plantagenets, a born princess of the blood royal of England, should mix herself up any longer with that hateful profession. Oh, how his soul loathed it! Indeed, on second thoughts, he decided 'twould be best for Maud to be set free from the classes for her ordinary music lessons. While his father lived, he couldn't have done without Maud; but now the head of the house was gone, never more should she be subjected to that horrid slavery. Enough that one member of the family should give himself up to it for the common good. Maud, poor delicate high-strung Maud, should at least be exempt. If he needed any help, he would hire an assistant.

The interview at the *White Horse* was quite satisfactory—too satisfactory by far, Dick thought, for he longed for a decent obstacle; and as soon as it was finished, Dick felt the hardest part of his self-sacrifice was yet to come. For he had to give up not only Oxford, but also Mary Tudor. For her own sake he felt he must really do it. He had never asked her to think of him till he got his Scholarship; and it was on the strength of that small success he first ventured to speak to her. Now that Oxford must fade like a delicious dream behind him, he saw clearly his hopes of Mary must needs go with it.

They were never engaged; from first to last, Mary had always said so—and Dick had admitted it. But still, they had come most perilously near it. During the long vacation, when Dick had had some coaching to do for matriculation at a neighbouring town, he and Mary had almost arrived at an understanding with one another. Dick was a gentleman now—he had always been a gentleman, indeed, in everything except the artificial position; and since he went to Oxford he had that as well, and Mary felt there was no longer any barrier of any sort interposed between

them. But now, all, all must go, and he must say farewell for ever to Mary!

It was hard, very hard: but duty before everything! With a beating heart he mounted the rectory steps, and for the first time in his life ventured to ask boldly out if he could see Miss Tudor. It would be the last time, too, he thought bitterly to himself—and so it didn't matter.

Mrs Tradescant was kinder than usual. Mr Plantagenet's sudden death had softened her heart for the moment towards the family—perhaps even towards Maud herself, that horrid girl, who committed the unpardonable offence—to a mother—of being prettier and more lady-like than her own eldest daughter. The lady of the rectory was in the school-room with Mary when Ellen the housemaid came in with the unwonted message that Mr Richard Plantagenet—'him as has gone up to college at Oxford, ma'am, has called for to see Miss Tudor.' Mary blushed up to her eyes, and expected Mrs Tradescant would insist upon going down and seeing Dick with her. But Mrs Tradescant had a woman's inkling of what was afoot between the two young people; and now that that horrid old man was dead, and Richard his own master, she really didn't know that it very much mattered. Young Plantagenet was an Oxford man, after all, and might go into the Church, and turn out a very good match in the end for Mary Tudor. So she only looked up and said with a most unusual smile: 'You'd better run down to him, dear; I daresay you'd like best to see him alone for a while, after all that's happened.'

Taken aback at such generosity, Mary ran down at once, still blushing violently, to Dick in the drawing-room. She hardly paused for a second at the glass on her way, just to pull her front hair straight and rub her cheek with her hand—quite needlessly—to bring up some colour.

Dick was dressed in hasty black from head to foot, and looked even graver and more solemn than usual. He stretched out both his hands to hers as Mary entered, and took her fingers in his own with a regretful tenderness. Then he looked deep into her eyes for some seconds in silence. His heart was full to bursting. How could he ever break it to her? 'Twas so hard to give up all his dreams for ever. At last he found words. 'Oh, Mary,' he cried, trembling, 'you've heard of all that's happened?'

Mary pressed his hand hard and answered simply, with a great lump in her throat: 'Yes, Dick dear, I've heard—and all these days long, I've lived with you constantly.'

Dick sat down on the sofa and began to tell her all his story. He told her first about his father's death and the things that had followed it; and then he went on to the more immediately practical question of what he was to do for his mother and sisters. His voice trembled as he spoke, for he was very, very fond of her; but he told her all straight out, as a Plantagenet should, without one word of the disgrace he felt it would be; he dwelt only on the absolute necessity of his doing something at once to provide for the family. 'And under these circumstances, Mary,' he said at last, looking down at her with some moisture in his brimming eyes, 'I feel that my duty to you is perfectly plain and clear; I must release you unconditionally from the engagement

which, as we both know, has never existed between us.'

Mary looked at him for a moment as if she hardly took in the full meaning of his words; then, in a very low and decided voice, she answered clearly: 'But I don't release you, dear Dick—and I shall never release you.'

'But, Mary,' Dick cried, unable to conceal his pleasure at her words, in spite of himself, 'you mustn't think of it, you know. It's—it's quite, quite impossible. In the first place, I shall never be able to marry at all now, or if ever, why, only after years and years, oh, Heaven only knows how many.'

'(That's nothing!') Mary sobbed out parenthetically; 'if necessary, I could wait a thousand years for you.'

'And then again,' Dick continued, resolved not to spare himself one solitary drop in his cup of degradation, 'it would never do for you to be engaged—to the local dancing-master. If it comes to that, indeed, I'm sure Mrs Tradescant wouldn't allow it.'

With a sudden womanly impulse, Mary rose all at once and flung herself, sobbing, on her lover's bosom. 'Oh, Dick,' she cried, 'dear Dick, I'm proud of you, so proud of you, no matter what you do—prouder now than ever! I think it's just grand of you to be so ready to give up everything for your mother and sisters. You seem to me to think only of them—and of me—and not a word of yourself; and I say it's just beautiful of you. I *couldn't* be ashamed of you if you sold apples in the street. You'd always be yourself, and I couldn't help being proud of you. And as for Mrs Tradescant, if she won't let me be engaged to you, why, I'll throw up the place and take another one, if I can get it—or else go without one. But I'm yours now, Dick, and I shall be yours for ever.' She threw her arms round his neck and, for the first time in her life, she raised her lips and kissed him. 'Why, what a wretch I should be,' she cried through her tears, 'if I could dream of giving you up just at the very moment when you most want my help and sympathy! Dick, Dick, dear Dick, we never were engaged till now; but now we *are* engaged, and you won't argue me out of it!'

Dick led her to a seat. For the next few minutes the conversation was chiefly of an inarticulate character. The type-founder's art has no letters to represent it. Then Dick tried to speak again in the English language. (The rest had been common to the human family.) 'This is very good of you, dearest,' he said, holding her hand tight in his own; 'very, very good and sweet of you! It's just what I might have expected; though I confess, being engaged chiefly in thinking of the thing from the practical standpoint, I *didn't* expect it, which was awfully dull of me. But we must be practical, practical. I must devote myself in future to my mother and sisters; and you mustn't waste all the best of your life in waiting for me—in waiting for a man who will probably never, never be able to marry you.'

But women, thank God, are profoundly unpractical creatures! Mary looked up in his face through her tears, and made answer solemnly: 'Oh, Dick, you don't know how long I would wait for you! I want to tell you something,

dear; to-day, I feel I can tell you; I could never have told you before: I wouldn't tell you now if it weren't for all that has happened. Eighteen months ago, when you first spoke to me, I thought to myself: "He's a charming young man, and I like him very much, he's so kind and so clever; but how could I ever marry him? It wouldn't be right; he's the son of the dancing-master."—And now, to-day, dear Dick, you darling good fellow, if you turn dancing-master yourself, or anything else in the world—if you sweep a crossing, even—I shall be proud of you still; I shall feel prouder of you by far than if you stopped there selfishly in your rooms at Oxford and never gave a thought to your mother and sisters.'

She paused for a second and looked at him. Then once more she flung her arms round his neck and cried aloud almost hysterically: 'Oh, Dick, dear Dick, whatever on earth you do, I shall always love you; I shall always be proud of you!'

And when they parted that morning, Richard Plantagenet and Mary Tudor were for the first time in their lives engaged to one another.

That's what always happens when you go to see a girl, conscientiously determined, for her sake, much against the grain, to break things off with her for ever. I have been there myself, and I know all about it.

THE SENSE OF SMELL IN ANIMALS.

TASTE and Smell are closely allied, even in man; while in the lower forms of life, especially the aquatic, the organs cannot be differentiated, though there is no doubt of the existence of the sense of smell, for the presence of odoriferous bodies is recognised. What we speak of as the *taste* of certain things—garlic, for example—is really the *smell*, for garlic is tasteless; a blind-folded man can hardly distinguish between the taste of an onion and an apple or between various kinds of wine; nor can a man, when in a dark tunnel, tell whether his pipe is alight or not. Smell, indeed, has been called 'taste at a distance.'

The sense of smell in the higher animals protects the respiratory tract; for the membrane lining the nose forms part of the organ in man and other mammalia; hence, the current of air needed for respiration also conveys odoriferous particles to the nose—thus unwholesome air may be quickly recognised and avoided. Further, the organ of smell being near the mouth, food may be easily examined by its smell before being actually tasted. This nasal membrane contains the olfactory cells, from which a delicate filament passes to the surface, ending in birds, reptiles, and other lower vertebrates, in a fine hair or group of hairs. A second filament runs deeper into the tissue, and is almost certainly there connected with the terminations of the olfactory nerve.

Insects, however, breathe differently, and therefore their organ of smell is probably differently situated, though it is true that some naturalists have endowed even insects with a nose having an organ of smell at the tip; while others have decided that this organ must be near the spiracles

or breathing apertures in the insect's body. It is now, however, almost certain that their organ of smell is in the feelers or antennæ, and partly perhaps in the palpe also. These latter are small jointed appendages attached to the lower lip. Possibly some smells may be recognised by the former, and others by the latter. When food was hidden from some cockroaches by a wall, it was found, evidently by its smell; but the cockroaches could not find it when similarly hidden, after their antennæ were removed. Carrion flies deprived of their antennæ cannot find putrid flesh. The emperor moths, and many other insects, discover their mates by means of their antennæ.

These slender, hair-like antennæ are of the greatest importance in insect life, though the complete and exact purpose (or purposes) they serve is still somewhat a matter of conjecture. They contain thousands of minute hollows, or pits and cones—often filled with liquid—each of which forms a termination to a different nerve, with its special sensory rod or hair. A wasp has some twenty thousand of these pits and cones; a drone-bee still more, the queen and working bees nearly as many; while cockchafers have from thirty-five to thirty-nine thousand; so that it is possible for the antennæ, small as they are, to contain the nerve-terminations, not only of the organ of smell, but also those of hearing and of touch. The small tubes or cones on the antennæ of some creatures, the hairs on others, and the tufts of hairs scattered over the body of yet others, are also connected in some way with the sense of smell.

But whatever may be the means, there can be no doubt that smells are not only perceived, but preferences shown that often seem strange to us. In that charming book, *Recollections of a Happy Life*, Miss North gives an example of some flies choosing a horrible-smelling food. One year when fungi were her particular hobby, she collected as many varieties as possible. Of these, Miss North says: 'One had a most horrible smell; it came up first like a large turkey's egg, and in that state was inoffensive; and as I was very anxious to see the change, I put it under a tumbler in my bedroom window one night, and the next morning was awakened by a great crash. Behold, the tumbler was broken into bits, and the fungus standing up about five inches high with a honey-combed cap, having hatched itself free of its restraining shell, and smelling most vilely. Good and bad smells are merely a matter of taste, for it soon attracted crowds of a particular kind of fly, which seemed thoroughly to enjoy themselves on it.'

Some stapelias have also a bad smell that attracts flies; in trying to get at the nectar, they are caught, cannot escape, and probably have their lives sucked out. The smell is so offensive that flies have even laid their eggs in the flower, mistaking it for carrion!

Bees are very fastidious in the matter of smells; they appear to object to the human breath, especially that of persons recovering from illness; therefore, to approach a hive with safety, be cautious how you breathe. It is probably chiefly by the sense of smell that bees and ants recognise their friends—that is, the members of the same hive or colony—for bees sprinkled with scented

syrup and then introduced into a strange hive will not be molested, as other intruders invariably are. Has each hive or colony, then, its own special smell? Even if this be the case, yet there is probably some other means of recognition as well, for some ants were purposely immersed for three hours, and were yet recognised after their bath—Mr McCook, however, disputes this—and friends have been recognised after a separation of six months, and in one case of nearly two years. Although there may be four hundred thousand or more ants in one nest, yet a stranger is at once known and attacked. Even when the pupæ and, in one case, the eggs were removed and restored to the nest later on as ants, they were treated as friends; for ants never appear to get ill-tempered or to quarrel with members of the same colony.

Sir John Lubbock mentions that when he put a few drops of Eau de Cologne or rose-water near the entrance of a hive, a number of bees at once came out to see what was the matter. This they did for several days, but finally lost their curiosity, and took no further notice. Ants are less excitable, and showed but slight surprise when various scents were placed in their path, though they evidently noticed them. A few drops of scent, however, instantaneously stopped some ant-fights, the foes becoming quite friendly, the scent appearing to overpower the smell of the enemy. It is by this sense of smell that ants chiefly find their food.

Animals sometimes show a curious fondness for scents that must be quite foreign to them in their natural state. For example, the late Rev. J. G. Wood describes a pet of his, a coati-mondi, a creature like a raccoon, that loved scent, always finding out any scented handkerchief, even if hidden. It would roll the handkerchief up into a ball, then sniff at it for some time in ecstasy, finally turning round and slowly rubbing it up and down its tail! Leopards, too, oddly enough, are extremely fond of scent; this susceptibility was the sole means used by a lady to completely tame a young leopard which eventually became a great pet. Whenever this leopard was obedient and gentle, she would give it a cardboard tray filled with lavender water; but no such treat was allowed if it scratched or put out its claws. The leopard used to sniff at the scent in the tray for some time and then roll over and over it till all was gone.

It is hardly necessary to dwell on instances of the keenness of this sense in animals; it is one of their chief means of protection from danger; for with many, such as the deer, it is this sense which gives timely warning of the approach of enemies; while some, such as the skunk and gambat, emit a most offensive smell when attacked, as a means of self-defence. With others it helps in the search for food and perhaps water; and with many it acts as a guide in the search for mates.

Smell also forms one of the chief means by which wild animals recognise their friends; some even have special glands like little pockets, which secrete odorous substances. The olfactory region is large in horses, sheep, and swine, but still larger in carnivorous creatures. In seals it is so large and protuberant that it almost blocks up the entry of the respiratory passages, probably

also serving somewhat to warm the air as well as to arrest every passing smell.

The sense of smell is by no means so developed in man as in dogs, cats, and other animals; but it is often abnormally keen in individuals deprived of other senses; blind deaf-mutes, for example, can recognise their friends, and form an opinion about strangers, solely by means of this sense. Possibly, however, animals are only sensitive to certain smells, while unconscious of others that affect us. If this be the case, they would naturally be able to follow up one particular scent more easily than a man—this scent, to which they are sensitive, being to them less confused with others. Dogs are able to track their masters through crowded streets, where recognition by sight is quite impossible; and can find a hidden biscuit even when its faint smell is still further disguised by Eau de Cologne. In some experiments Mr Romanes lately made with a dog he found that it could easily track him when he was far out of sight, though no fewer than eleven people had followed him, stepping exactly in his footprints, in order to confuse the scent. The dog seemed to track him chiefly by the smell of his boots; for when without them, or with new boots on, it failed; but followed, though slowly and hesitatingly, when his master was without either boots or stockings. Dogs and cats certainly get more information by means of this sense than a man can; they often get greatly excited over certain smells, and remember them for very long periods.

Many birds, as is well known, are guided to their food by the sense of smell; but it is doubtful whether this sense is actually as keen in birds and reptiles as has been usually supposed. Mr A. R. Wallace tested the acuteness of smell in vultures, when he was in South America, by throwing food into long grass or wrapping it up in paper. The vultures, which were extremely persistent and annoying in following him, would hop close up to the paper, but without discovering it contained anything eatable, however putrid, and therefore palatable, the contents might be. Nor could they find food when hidden by the long grass. If sticks were thrown down, they would eagerly fly after them, evidently under the impression that they were eatable; yet the vulture's olfactory nerve is five times as large as a turkey's! The sense is, however, very highly developed in the apteryx—the ostrich of New Zealand. This bird has, in proportion to its size, the largest olfactory nerve of any bird, probably even finding the worms beneath the ground, which form its food, by means of smell. Birds, in common with cold-blooded reptiles and amphibians, cannot dilate or contract their nostrils; in fact, these are merely apertures, often so small—as with the heron—that the point of a pin can hardly enter. In crows, these apertures are protected by a stiff bunch of feathers, and in scratching birds by scales. Pelicans have no external nostrils, scents reaching their organ of smell by the palate.

The nostrils of cetaceans are high up, on the top of the head; these form their 'blowholes,' and can be completely closed. With the exception of the baleen or whalebone whales, they have, however, no olfactory organ, and therefore no sense of smell. The external orifices in water-

snakes, seals, crocodiles, and alligators can also be closed by means of a valve.

Many fish habitually seek their food by means of smell, slightly aided by touch, but very little by sight. Many 'scent' or search for olfactory impressions. The nostrils are usually double and pocket-like, closed with a valve, and do not communicate with the mouth. Prawns can certainly smell, for, when blind, they can still find food and also find their way home. Crayfish have, besides their long antennæ, smaller antennules, each of which has an inner and an outer filament. On the under surface of the outer filament are two bunches of minute flattened organs; these are probably olfactory.

Oysters are very deficient in the matter of senses; they do not even appear to possess a sense of taste, which seems somewhat unfair. They have no eyes—though slightly sensitive to light—no sense of hearing, and very little, if any, of smell; in fact, a very slight sense of touch seems to be all that is left them. Owing to their sedentary habits, they have lost, or nearly so, the foot, which in molluscs often contains the nerves of various organs, such as that of hearing. The foot of a snail is a very superior organ, and contains numerous sensory nerves. Probably some are olfactory, for, though the sense chiefly resides in the horns, the snail still possesses this sense in some degree, even after the horns are removed. The anterior pair of horns or tentacles in a snail have a nerve-knot or ganglion at the end, from which fibres pass to the surface. These may also be olfactory nerves.

The actual cause of smell is still a matter of some dispute and uncertainty. One theory is, that scent is due to particles given off by the smelling substance; if so, they must be infinitesimally small particles; for a single grain of musk is said to scent a room for years; and scent in air that has been filtered through cotton-wool is still recognisable, though the cotton-wool would have removed substances as minute as the one hundred-thousandth part of an inch in diameter. It is more probable that the sense is excited only by the gas or vapour given off by substances, not by the solids or liquids themselves. For water-breathers, however, the substances may be in solution.

Professor Ramsay has lately propounded the very interesting theory that smells are caused by molecular vibrations, slower than those which give rise to heat or light, different smells being caused by vibrations of different rates. This explanation, however, still remains in a theoretical stage.

We know that when we have a cold, so that the mucous membrane becomes thickened, as well as when it is too dry, smells lose their intensity: the olfactory surface, to be sensitive, must be moist therefore. So, too, when the atmosphere is moist, as in the morning, the scents of flowers are more perceptible than when it is dry.

Different odours can be smelt and separately recognised at the same time. It has been suggested that it is because the olfactory nerve has a direct connection with the brain that smell is such a suggestive sense; that 'memory, imagination, old sentiments and associations, are more readily reached by the sense of smell than by almost any other channel.' Dr Oliver Wendell

Holmes says: 'There may be a physical reason for this strange connection between the sense of smell and the mind. The olfactory nerve is the only one directly connected with the hemispheres of the brain, the parts in which, as we have every reason to believe, the intellectual processes are performed.'

RALPH THORNLEIGH'S PICTURE.

CHAPTER III.

'Mrs TOTWORTHY,' said Ralph Thornleigh to his landlady one morning, 'I've got an order for a picture.'

Mrs Totworthy paused in her work of clearing the breakfast table to stare at her lodger. He spoke with a gravity which would have befitted an announcement that he had been committed to prison for debt. It was puzzling; and she waited to hear more; but Mr Thornleigh evidently had nothing further to say, for he took a letter off the mantel-piece behind him and began to read it.

'And there bein' a matter of three weeks' rent a-owin', I'm glad to 'ear it, Mr Thornleigh,' said Mrs Totworthy. 'I 'ope as you'll arsk for a pound or two on account.'

'I'll pay you up to date if I can get a small advance,' replied her lodger. 'I'm sorry to have been so behindhand lately; but things have not been going well, you know.'

Mrs Totworthy nodded good-naturedly; poor folk understood poor folk, she said, and it should never be told as 'ow she was ever 'ard on them as worked for their bread like herself. And after stealing a furtive look at the letter Mr Thornleigh held in his hand, she took up the tray and left the room.

'There can't be two Colonel Stardales in London,' murmured the young man to himself as the door closed; 'and yet it would be strange if I were brought in contact with *him* in this way. Let's see; I am to be at his chambers some time this morning between eleven and twelve.' Here Ralph raised a hand towards his watch-pocket, and let it fall again with a little sigh. 'It went ten some time ago,' he continued half aloud; 'so I may as well start at once, as it's a long way.'

He put on the most presentable coat in his limited wardrobe, took his hat, and set out for St James's Street, wondering what might be in store for him. This Colonel Stardale wrote saying that Mr Gustav Schenk, the photographer, had recommended Mr Thornleigh as an artist capable of executing a small order, and requesting him to call and receive directions about the work. The note was written in the third person, and no Christian name or initial proved the writer's identity with the future husband of Beatrice Cairnswood.

Ralph Thornleigh had not been himself for the last few weeks; he had battled bravely with poverty, even with want, until the day he received that letter from Beatrice telling him of her engagement to Colonel Stardale. Then he lost heart: hope and ambition took wing together, and left him caring little whether he had work or not. He felt no jealousy of his unknown rival; only a helpless envy for the wealth which had gained him Beatrice. If the man whose letter lay

in his pocket were her intended husband, he could meet him and converse as composedly as though he were a total stranger.

He found the house without difficulty, and was ushered up-stairs into a luxuriously-furnished room, where he was requested to wait until 'the Colonel' was informed of his arrival. Many months had elapsed since Ralph had been inside a gentleman's house, and he stood looking round at the treasures which filled the room, awkwardly conscious that his shabbiness was out of place here. As he glanced from one picture to another, an envelope lying on the writing-table caught his eye, and half involuntarily he looked at the address, 'Colonel Melton Stardale;' and the handwriting was that of his lost love.

He had scarcely taken in the fact that he had indeed been summoned by Beatrice's future husband, when the door opened, and the Colonel entered. 'Mr Thornleigh, I believe. Sit down, Mr Thornleigh. I am indebted to you for your prompt attention to my note.'

Ralph bowed silently, and took the chair indicated. It was obvious that Colonel Stardale had no suspicion who he was, and he waited to hear what work the gentleman had for him to do.

'I am informed that you excel in copying portraits, Mr Thornleigh,' the Colonel went on, 'and shall be glad if you have time to undertake a commission of the kind for me.'

Ralph would be very happy. He was to enlarge a photograph of Colonel Stardale, no doubt.

'I have a copy of the portrait here,' said the Colonel, opening a drawer and handing a cabinet photograph he took therefrom to Ralph. 'I trust you will be able to do justice to it.'

With a superhuman effort, the young man controlled himself as he took the picture in his hand. His heart was beating as though it would burst; but he sat listening to his patron's directions with a face as unmoved as that on the card before him.

'I could have wished the lady to have given you a few sittings,' continued Colonel Stardale, 'but am anxious to keep the fact that the picture is being painted a secret from her. I—ah—intend it for a wedding gift,' he added with explanatory condescension.

Ralph, who had risen to receive the photograph, grasped at a chair to support himself, and prayed silently that the interview might come to a speedy end. He should betray himself if tried much further.

'Can you manage to paint the picture without sittings?' inquired the Colonel.

Could he portray the face which haunted him day and night! His voice sounded hoarse and distant to himself as he replied that he could; had often done so before.

'Will you be good enough to mention your terms?'

'Twenty-five guineas,' answered Ralph, scarcely knowing what he said.

Colonel Stardale signified his willingness to pay the sum named, and asked that he might be informed when the picture was ready. Ralph promised to write; and declining the glass of sherry his patron offered, reached out a trembling hand for the photograph. He forgot to ask for an instalment of the money; he never thought

of inquiring whether the picture was wanted by any special date; his brain was paralysed, and he groped his way down-stairs like a man walking in his sleep.

He did not remember his empty purse until he arrived in Wenside Street, when Mrs Totworthy reminded him of his promise in respect to that little matter of rent.

'Forgot!' ejaculated the good woman; 'well, I never!'

'I'll write at once,' said Ralph; 'don't bother me just now, there's a good soul.'

Mrs Totworthy studied his pale drawn face for a few seconds and accused him of being ill. When Ralph humbly denied the charge, she modified it to an assertion that he wanted some tea; that beverage, brewed the colour of London double stout, being Mrs Totworthy's panacea for all human ills.

Ralph wrote his letter to Colonel Stardale, and drank the tea his landlady pressed upon him. Then he went out to order a canvas for the picture. He had been telling himself ever since he returned to his rooms that he must harden his heart, and set to work on the portrait as he would upon that of a stranger; that he must forget what Beatrice was—had been—to him, and deal with Colonel Stardale's order as a pure business matter. It had come in the nick of time, for he had hardly a shilling in his pockets.

He ordered the canvas, and arranged to call for it on the following morning. Then he bought something to eat, and decided, as this was the last idle day he was likely to have for some weeks, he had better go for a walk. He had not ventured into the better parts of the town, where he might meet people he knew, for a long time. But this afternoon he was conscious of a hungry yearning to obtain a glimpse of the happier world whence he had so lately fallen; so he turned Westward and went into the Park.

He wandered across the grass, past the Serpentine, and mingled with the crowd. His acquaintance in London had not been a very wide one, and he grew more confident as he strolled along without encountering any one he knew. There were plenty of men there in boots as patched, in hats as disreputable, and trousers as baggy at the knees as his own. No one noticed him; and as he leaned over the railings to watch the carriages as they rolled by in a continuous stream, he began to think that the strict seclusion to which he had condemned himself had been unnecessary; that this would have been a better place to lounge away his hours of enforced idleness than his gloomy rooms. Two or three conveyances passed whose occupants he knew; but though he met the gaze of some, they appeared not to recognise him; and he derived a melancholy satisfaction from their shortness of sight or memory.

It was a lovely afternoon in early March, and numbers of people were driving in the Park; the endless procession of carriages grew denser as Ralph stood watching, and now and then it paused to move on again at a foot-pace until the way became clearer. Ralph had been a great horseman in the days when his father lived, and the horses received more of his attention than their owners. Presently, a pair of thoroughbred bays were sharply pulled up right in front of

him; he looked the animals over with critical admiration as they chafed and fretted, then raised his eyes to glance at the people in the carriage. On one seat he saw Colonel Stardale, and a lady he recognised as Miss Macallan; and as the 'block' eased off and allowed the equipage to move on a few paces, he saw Beatrice Cairnswood right before him almost within arm's length. A half-suppressed exclamation escaped his lips; she turned, and their eyes met. The carriage drove on and Ralph hurried away towards the Corner, and lost himself in the street crowds. He had seen her again after a separation of many months, and with a look upon her face that had burnt into his inmost soul: he felt that unless he found food for his mind, he should lose his reason; that he must work or go mad.

Next morning's post brought him Colonel Stardale's cheque for ten pounds, and he lost no time in cashing it, and bearing home the canvas which was to receive the portrait of Beatrice. Noon found him at his easel, charcoal in hand; but no photograph stood on the ledge before him. He wanted no aid so paltry as that. Mr Schenk's production would only hamper memory, and from memory he intended to paint her.

Never before had Mrs Totworthy known her 'fourth-floor front and attic' so busy, or so silent at his meals; he rarely spoke to her, and though she strove to spur him into speech with stale bread and underdone chops, he ate without remark whatever she placed on his table. It puzzled Mrs Totworthy. Mr Thornleigh at one time had been the lightest-hearted of men; then all of a sudden he had grown miserable and dejected, passing day after day in listless idleness. Now he was all haste and energy, swallowing his breakfast in ten minutes, and rushing up-stairs to the attic 'studio' where he spent every hour of daylight. That the secret of the change lay in the little room under the skylight, Mrs Totworthy could not doubt; but as Ralph kept the door locked, and the keyhole loyally refused to disclose the mystery, the landlady gave up trying to solve it, and exhausted her ingenuity in the wildest conjectures. This state of affairs continued for some weeks; but at length the young artist ceased to work at high pressure, and, as Mrs Totworthy observed, 'took it easy' again. That glimpse of Beatrice in Colonel Stardale's carriage had inspired Ralph Thornleigh. As he hurried out of the Park that day he gave up all thought of copying the photograph with the cold exactness he was used to bestow on such work. He threw himself into the picture heart and soul; he lived in it, and for it only, wielding his colours with a deftness that surprised himself. Now it was finished, and he was lingering over the accessory details, bent on showing up the face to the best possible effect. He spent far more time than was at all necessary over this; but he had come to dread the day when he must part with the picture, and made a lengthy process of 'touching up' an excuse for postponing it. He had not brought the photograph into requisition at all; the pose was simplicity itself, and the dress was not an elaborate creation which required 'copying' in the accepted sense of the term.

Now his labour of love was completed, and for the first time Ralph took Mr Schenk's pro-

duction and placed it beside his own picture. He smiled sadly as he did so; they were so like and yet so different. The photograph showed a calm passionless Beatrice. The portrait showed the Beatrice Ralph had seen for a moment in the Park, and he had caught the expression she wore as their eyes met, with startling fidelity. It was a master-piece; but it was not a copy of the photograph, and Ralph knew it. He did not care; a fierce recklessness possessed him, and he would not raise his brush again. Colonel Stardale should see his bride through her lover's eyes.

He had taken so long to execute his commission that he was not surprised to receive from the Colonel a note asking what progress had been made, and when he might expect to receive the portrait. Ralph wrote back that he had just put the final touches, and would bring the canvas to St James's Street next day. This offer the Colonel declined; he would take the liberty of inspecting the portrait at the studio, with Mr Thornleigh's permission, so that the artist might be spared the trouble of carrying it to and fro if any trifling alterations should be required.

Accordingly, No. 210 Wenside Street was honoured with a visit from that gentleman the following day; and Mrs Totworthy was thrown into a paroxysm of intoxicated pride by the spectacle of a brougham and pair with servants in livery standing for a full twenty minutes at her own door. The oldest inhabitant failed to recall a precedent for such an apparition in Wenside Street; and as Mrs Totworthy marked the rows of open windows thronged with gaping neighbours, she resolved that no irregularity in Mr Thornleigh's weekly payments should cause her to weigh the propriety of giving him notice, as she had sometimes done ere now. A lodger who received such a visitor as this raised the tone of the house, and deserved the utmost consideration.

While Mrs Totworthy and a select circle of female friends were thus innocently enjoying themselves on the ground-floor, Colonel Stardale, seated in Ralph Thornleigh's chair, was studying the portrait through his eyeglass with looks which denoted anything but gratification. After a short survey, he leaned back and beckoned majestically to the artist, who stood at a respectful distance awaiting his verdict.

'I am disappointed, Mr Thornleigh,' he said; 'I am sure the lack of resemblance between your copy and the original must be patent to you. It would be remarked by the merest tyro.'

Ralph could not defend himself, and made no reply.

'I have no doubt you have done your best, but you must pardon my telling you that this is simply a caricature.' He tapped the canvas with his glass as he spoke and paused, as though expecting an answer; but none was forthcoming, and the Colonel continued.

'By no stretch of imagination can it be called a copy, and I will not trouble you to make another attempt. I am surprised at this result of following Mr Schenk's recommendation. I shall take an early opportunity of expressing my views to him on this point.'

It was a matter of supreme indifference to Ralph whether the photographer paid with his life for his *misdeeds*, so he remained silent.

'You are prepared to hear that I cannot accept this—ah—picture, Mr Thornleigh?'

'Of course I do not expect you to take it if it does not give you satisfaction,' replied Ralph.

'I am very sorry to disappoint you,' said the Colonel, rising from his seat. 'We will say nothing about the—ah—small advance you received. The work has, I doubt not, cost you much time.'

'You are very good,' rejoined Ralph, 'but',—, recollecting he had just eight shillings and ninepence in the world, he broke off abruptly.

The Colonel waved a patronising hand, and begged him to say no more on the subject.

'And oblige me, Mr Thornleigh, by destroying that—ah—picture. I will assume that I have purchased the right to request its destruction. Ah! the photograph,' he added, as Ralph handed it to him. 'Thank you, Mr Thornleigh. Good-morning to you, Mr Thornleigh.'

Ralph escorted the Colonel down-stairs, saw him into his brougham, and then came back to his studio, where he sat down and devoured Beatrice's portrait with all his eyes. 'A caricature.' Was it?

'I may be wrong,' he said half aloud, 'but I think not. Anyway, I won't destroy it. I think I'll ask Brandon to come and take a look at it; there's something in it if I'm not mistaken.'

Mr Brandon was a brother-artist who had commenced life in London at the same time as himself, but who had advanced many steps farther than he had on the road to success. He lived in a quiet street off Cavendish Square, and thither Ralph repaired, soon after Colonel Stardale had gone.

He found Mr Brandon at home, and obtained his promise to come to Wenside Street on the following day to criticise the 'Portrait of a Lady,' which he jealously declared to be a creation of his own fancy. His friend knew nothing of Miss Cairnswood, and Ralph had no intention of disclosing the true story.

In due time Mr Brandon appeared at his lodgings, accompanied by another artist whom he had encountered on the way; and the committee of inspection went to the studio.

'Well, what do you think of it?' asked the young painter, after the two had placed his picture in a few different lights, and scrutinised it from as many distances as the room permitted.

'I'll tell you what my opinion is, Thornleigh,' replied Mr Brandon. 'I think that's a work for the Academy, and I shall be surprised if Danes doesn't think so too.'

Mr Danes, who was a man of few words, nodded emphatically. 'Talent there. No two words about it. Love in Despair. The Academy, of course.'

Ralph had fallen in love with his picture, which was scarcely to be wondered at, all things considered. But he had never anticipated that his friends would rate its artistic merits so highly, and slumbering ambition sprang up again.

'If you fellows really mean what you say, I'm sincerely grateful for your advice,' he said. 'But what about the frame? I tell you frankly I'm on my beam-ends, and don't know any maker who would trust me.'

'Know Bubblestock?' inquired Mr Danes, thoughtfully.

Ralph shook his head; he knew Mr Bubblestock's gallery in Bond Street, but had never met the proprietor.

'Sharp man,' said Mr Danes—'knows a picture when he sees one. Give you a letter of introduction.'

'You're very good; but I don't quite follow you.'

Mr Danes, who had seemingly exhausted his stock of language, looked appealingly at Mr Brandon, who promptly explained.

'Bubblestock has a great idea of Danes' opinion, Thornleigh,' he said. 'If Danes advises him to come and see your picture, he will be round here like a terrier after a rat. His approval is a certainty; and he will supply you with the frame if you promise him first refusal of the picture after the Academy closes. He is a very liberal man, and will give you a good price. You will have got your foot on the ladder, my boy, if Bubblestock takes you up.'

Ralph's eyes glistened, and he turned to Mr Danes with a torrent of thanks.

'Notepaper!' demanded that gentleman with brusque but practical economy of words.

He was speedily placed at the table with writing materials, and he scribbled off his note to the great picture-dealer, whose fiat had been the making of more than one artist. 'Go at once,' he said, handing Ralph the missive. 'Don't waste time talking.'

'No one ever accused you of that, Danes,' laughed Mr Brandon as they prepared to leave. 'Good-bye, Thornleigh. I shall come and congratulate you when the critics have said their say about your work.'

When they had gone, Ralph threw himself into a chair to think over the situation. The picture, as a picture, was evidently destined to succeed. But how would Beatrice like to see herself in the Academy in this guise, supposing it were actually 'hung'?

His mind was quickly made up. He went to his desk and wrote to her. He said nothing of Colonel Stardale's commission; that did not affect the point at issue. He told her how, after seeing her in the Park, he had painted her portrait, and how friends whose opinion was trustworthy had strongly advised him to exhibit it. Would she allow him to do so, withholding her name? If she were in the least averse to the idea, he would not think of doing so.

Beatrice replied by return of post; she told him to act upon his friends' recommendation and exhibit the picture with or without her name, as he thought best. If she were thus the means of bringing him success at last, she should be happier than she thought it possible she ever could be again.

So Ralph went to see Mr Bubblestock, and that authority lost no time in coming to see the picture. Our friend was almost happy when he retired that night. The dealer had done more than Mr Brandon predicted. He undertook to send for the canvas, frame it at his own expense, and despatch it to Burlington House. He stipulated for 'first refusal' when the Academy closed, and paid Ralph thirty guineas down by way of earnest money. And, finally, he promised to bear

the young man's name in mind, when he had any work to be done.

That was a red-letter day in Ralph Thornleigh's calendar, and he celebrated it by dining sumptuously at the Criterion. He was very doubtful about his right to dispose thus of Beatrice's picture, when Colonel Stardale had waived the advance he made on condition that the canvas should be destroyed. But he overcame this difficulty; he put a ten-pound note in an envelope, wrote a few lines to the Colonel, saying he wished to keep the picture, and so felt bound to refund the money, and took the letter down to St James's Street himself. That done, he walked home with a clear conscience; Beatrice's picture was his own now to do what he pleased with.

SEWAGE TREATMENT BY THE ALUMINOFERRIC PROCESS.

THE problem of Sewage Disposal is one that is constantly with us, and which appears, nevertheless, as difficult of solution as in the earliest days of sanitary science. Various methods of disposing of sewage are in vogue, each accompanied by its own drawbacks and disadvantages, and no system has yet so demonstrated its claim to superiority as to compel its universal adoption to the exclusion of all others. Indeed, so widely divergent are the local exigences of each individual case, that every locality should be considered in regard to the special circumstances surrounding it; and a hard and fast system applicable to every case is, in our present state of knowledge, scarcely likely to be attained.

As our readers are aware, the methods of sewage disposal may be ranged into three great classes: (1) Direct discharge into a river, an estuary, or the sea; (2) Land irrigation, popularly known as sewage-farming; (3) Chemical precipitation or deodorisation. The first-named system in the case of rivers is obviously productive of much nuisance and danger to public health; and even in cases where discharge to sea is possible, much difficulty prevails in obviating all evil effects, and in completely safe-guarding against unpleasant consequences at all states of the tide and in every wind. Moreover, on strictly chemical grounds, and viewed as a matter of economic science, the loss to the country by such means of immense quantities of fertilising agents, which preferably should enrich and ameliorate the soil, is regarded by practical sanitarians and skilled statisticians as contrary to sound principles.

The second method—treatment by land irrigation—though sound enough in theory, presents many features of difficulty in practical application, the greatest of which is perhaps that of obtaining sufficient land of any kind, especially in densely populated districts, where, of course, sewage treatment is most urgently required. Thus Dr Letheby estimates that to irrigate with the sewage of London would require two hundred thousand acres, or an area nearly three times that of London itself. Another great difficulty is the unintermittent supply to be dealt with, whether the soil needs it or not, and whether the farmer's

operations require manure or not. Moreover, in all weathers the supply is maintained, with the practical result that it is not infrequently turned into the nearest river or the sea in times of necessity, when it cannot be dealt with on the land. Storm-water is, moreover, a constant source of difficulty, as it largely augments the volume of material to be dealt with, and increases to a considerable extent the area of land requisite for the sewage farm. When it is considered that rain is calculated to fall in this country on no fewer than an average of a hundred and fifty days in the year, the importance of considering the volume of rain-water passing into the sewers of a city will be realised.

We now pass to the third system of dealing with sewage—by chemical precipitation; and the problem resolves itself into the practical question of what is the best and cheapest material to yield an effluent clear, colourless, permanently non-putrescent, and capable of sustaining fish-life, whilst producing a 'sludge,' small in quantity, easily filter pressed, containing as much of the manurial constituents of the sewage as possible, and able to be kept without producing smell or nuisance. With a view to meet these requirements, the substance known as 'Aluminoferrie' has been invented and patented by the Messrs Spence of Manchester, and is at the present time already employed in over thirty towns and villages in this country for sewage purification. Aluminoferrie can be applied in two forms, either solid or in a liquid state: in the former case, slabs twenty-one inches long by ten inches wide by four inches thick are manufactured, and are simply placed in a cage fixed in the flow of the sewerage, such method being found very advantageous for dealing with small quantities of sewage up to about half a million of gallons in the twenty-four hours. In the case of larger quantities, it is found more economical to dissolve the aluminoferrie in a special vessel, admitting it when dissolved into the flow of sewage, the quantity admitted being automatically regulated as the volume of sewage fluctuated. The quantity of aluminoferrie required varied necessarily in every instance, and may be stated to range from seven to twenty hundredweight per million gallons of sewage, the latter quantity being requisite when much dye and other colouring refuse requires precipitation. The disposal of the 'sludge'—that is, the solid matter precipitated when the clear effluent has flowed away—is mainly of course one of cost: in some instances it is conveyed to sea; in others, either pressed or uncompressed, it is used for manurial purposes, the advantages of compressing the cake being the great reduction in volume obtained, with increased facility in handling, storing, and transporting.

The advantages of the aluminoferrie process may be briefly stated to be the perfect simplicity of the system, together with the purity of the effluent produced. Being in solid slabs, aluminoferrie is easily handled, and the cost of the substance is only from £2, 15s. to £3, 5s. per ton, varying necessarily with the length of carriage incurred. The process requires little or no alteration of plant, where suitable settling tanks are already provided, and is readily under-

stood and carried out without special skilled supervision. As already stated, the process is being used with much success, and bids fair to obtain extended development as its advantages become known.

THE HOARD OF THE VAZIR KHANJI.

By HEADON HILL.

It was high noon, and traffic through the city gate of Dilnagar had died away. One by one, creaking bullock-carts and footsore travellers, toiling across the dusty plain towards the ancient Kattiawar stronghold, had come to a halt under what shade they could find by the wayside, to wait for the cool of the evening for the fulfilment of their journey. And there were none in the city whose business was so pressing that they were compelled to leave its shelter in the blistering glare of the mid-day sun. In a few days the south-west monsoon—the much-needed *barsāt*—would break, gladdening the thirsty land with plashing showers, and cooling the sultry air with breezes fresh from the Indian Ocean. Then, for a month or two, crowds would jostle through the narrow archway in two unceasing streams from dawn to sunset again. But at the hottest hour of this broiling day the main artery of Dilnagar was pulseless.

Not quite deserted, however, and not quite silent, was the gateway. A wild-looking matchlock-man, one of His Highness the Thakore's bodyguard, slumbered peacefully in his niche, waking the echoes of the archway with a series of blood-curdling snores. The sounds proceeding from the sleeping guard drowned all others, even the lazy hum of the distant bazaar; but a pair of sharp ears listening intently might have discerned a fainter sound, which ever and anon struggled to assert itself in plaintive contrast to the harsh discord that quelled it—the sound of a feeble voice crying in the Guzerati tongue: 'Water! For the love of God, bring me water, or I die!'

The wailing cry came from the foot of the city wall just outside the archway, and at first sight it would have been difficult to identify its origin with anything human; so bent and huddled was the shapeless filth-encrusted form from which the voice proceeded. But on nearer inspection the wizened features and glittering beady eyes, half hidden with masses of tangled and dirty hair, would have proclaimed their owner a man, and a man in sore extremity. He was only sustained from falling prone to the ground by an iron ring round his neck, the other end of which was built or thrust into the city wall in the form of a staple, and which thus kept him in a sitting posture. His clawlike hands were furnished with nails half a foot in length, and these were dug in agony deep into the burning sand. The fragments of a broken *lotah*, or water-vessel, at his side told plainly of the accident that was doing the Fakir Indrajī to death.

For nigh on seventy years the Fakir had borne his self-inflicted torture outside the ancient gateway. There were old men in Dilnagar, but none so old that they could remember the time when that spot had been tenanted. Day and night through the long years the holy man had sat there, bound by his iron ring, begging and

praying by turns till he became one of the institutions of the place, and pilgrims came to touch his hoary locks and go away comforted. His wants and absolute necessities, such as they were, were attended to by the priests of a neighbouring temple, one of whom came twice a day to bring him food and bear off any alms he might have taken. Indrajī retained nothing for himself. None can say for how many years longer he would have kept his post, had it not been for the chapter of accidents which broke his water-vessel and brought the sleepest soldier of the Thakore's bodyguard on duty at the same burning noontide; but as it was, the aged Fakir's time was come.

Fainter and fainter grew the old man's cries for help, till they were little more than a wordless moan. His head fell back against the encircling collar, and his tongue began to loll from his parched lips; but still no one came, and the pitiless sun went on baking the wall behind him to the temperature of an oven. The fierce black eyes were becoming glazed, and the familiar objects on the plain were assuming fantastic shapes in the disordered vision of the dying man, when suddenly a distant footstep brought a ray of hope—a firm, swinging footstep, too, that told of honest boot-leather—not of the shuffling approach of some sandal-shod or bare-footed native. Nearer and nearer up the road from the open country came the welcome sound, and just as Indrajī put all his remaining strength into one last feeble cry of 'Water!' a tall young Englishman sprang to his side, and, unslinging a leathern bottle, held a cup of the cooling liquid to the Fakir's lips.

'Thanks, Sahib, thanks,' the old man murmured in Hindustani as he finished the last drop of the precious draught. 'You come too late to save my life, though in time to make death easier. Thy servant is grateful.'

'Tell me where I can find help or how I can move you from here,' answered the young man, whose dusty, travel-stained appearance and inquiring glances bespoke him a stranger to Dilnagar.

'You have given me all the help I need,' replied the Fakir, 'and I move not from this spot till the Angel of Death releases me from my vow. Indrajī is weary, and thanks God that that time is at hand.—But tell me of yourself, young Sahib. Feringhis are scarce in Dilnagar. 'Tis close on a year since a white face passed through the city gate.'

'It is because white faces, as you call them, are scarce in Dilnagar that I am here,' laughed the young Englishman a little bitterly. 'There are times, as you must know, good Fakir, or you would not have adopted this mode of life, when the society of one's fellows is best avoided. It is so with me.'

'So young, so brave, so merciful, and yet with the sound of despair in his voice!' the old man half whispered to himself, eyeing his visitor intently. For a few moments he seemed to fall into unconsciousness, and gazed out over the plain with a far-away expression on his face that was eloquent of the coming end. But just as the Englishman had decided to go for assistance, the Fakir spoke once more.

'Feringhi,' he said, 'I have not many hours

to live. To-day's parching thirst has conquered a body worn out with the batterings of close on a hundred years, seventy of which I have spent as you see me now. You have relieved me in my sore necessity, and I would fain do you a service. Perchance you will not believe in the old Fakir's charms and amulets, but I beg of you to put it to the test, and see if Indrajī has not spoken truly. Take this, and open it only when you know that I am dead. It will bring you your heart's desire.' As the Fakir spoke, he fumbled in the ragged cloth that girt his loins and drew forth a quill, three inches long and sealed up at both ends. This he thrust into the young Englishman's hand. 'All that that charm may bring you,' he proceeded, 'is yours, bestowed by Indrajī the Fakir for reasons which will hereafter be revealed to you. All that I ask in return is, that you mention that quill and its contents to no one—no matter whether he be Sahib, Hindu, or Mohammedan—till you have read and understood what the quill contains.—Have I your promise to preserve absolute silence? You will not have long to wait before you may break the seals.'

The young man slipped the Fakir's charm into his pocket and gave a careless assent. Naturally, he had no faith in the old mendicant's wizardry; but his good nature prompted him to humour the quaint request. Satisfied that the gift had been graciously received, Indrajī made a sign towards the gateway.

'Now go on your way, Sahib,' he said; 'and as you pass the temple with the red walls, before you reach the great bazaar, stop, of your goodness, and ask one of the holy men to come to me. My blessing go with you.'

The traveller, seeing that he could be of no further use, took the Fakir at his word. Passing through the gloomy archway, where the match-lock-man still slept on, he struck into the main street that led through the heart of the city, and, after giving information of the Fakir's condition at the temple which had been indicated, made his way to the semi-barbaric palace of the Thakore. While he is parleying with the door-keepers and doing his best, by persuasion and a little 'backsheesh,' to obtain an audience of the great man, let us see what it is that brings Basil Heygate on foot and alone to a purely native city in a non-British State, where Europeans are seldom found.

Only a month before, and Heygate had been one of the gayest and smartest subalterns in the 30th Hussars, which regiment was then quartered at the up-country station of Mhow. He was a favourite with his brother-officers and with the men; his father was wealthy, and made him a liberal allowance from home; and his professional duties were carried out in a manner which ensured him a successful military career. Suddenly, one fatal mail-day all his bright prospects were dashed to the ground by the receipt of a letter from England which told him that his father had been ruined by unfortunate speculations, and had died under the shock. It was quite impossible for Heygate to remain in the service under the altered conditions. Without the handsome additions to his pay which he had received from home, he would barely be able to defray the mess expenses of a crack cavalry

regiment; and he took the only course open to him. He laid the circumstances of the case before his Colonel, obtained six months' leave of absence to England, pending retirement, and went down to Bombay with a view to returning home by the next steamer. But here a sudden impulse changed all Basil Heygate's plans. While waiting at the hotel, he chanced on a paragraph in one of the Bombay papers announcing in a jocular vein that Gholam Singh, the Thakore of Dilnagar, was about to purchase the cast-off uniforms of a native infantry regiment, in order to give the half-wild levies who formed his body-guard the semblance of civilised troops. The writer of the paragraph drew a humorous picture of the figure these hitherto half-clad warriors would cut when dressed as regular soldiers, but without any knowledge of drill; and he ended by advising the Thakore to buy up 'a second-hand sergeant-major' to supply the deficiency.

The hint was enough for Heygate. If the Kattiawar chieftain was bent on Europeanising his forces, he, Basil Heygate, was the man to do it for him. It would be a terrible drop for the once gay officer of hussars to swell the retinue of a native rajah, even though he were appointed generalissimo to begin with; but it would be better than the idleness and uncertainty which would be his lot on reaching England; and at anyrate, if he found the new life unbearable, he was not compelled to stay. Again, Dilnagar being a 'protected' State only, and not immediately under British control, there would be none of his fellow-countrymen there to remind him by their presence of his own altered position. As for his retirement from the English army, it would be just as easy to send in his papers from Dilnagar as from London; and having six months' leave, there was no need for haste. After a risky week's voyage in a native craft to Verawal, the Kattiawar port, where he left his baggage, an eighty-mile tramp brought him to the scene of his adventure with the Fakir.

Thus it was that Basil Heygate found himself ushered into the presence of Gholam Singh, Thakore of Dilnagar, and vassal of Her Most Gracious Majesty the Empress of India. Gholam Singh was a fifth-rate potentate, not even deemed worthy by the supreme Government of entertaining a British 'Resident' at his court, the result being that Dilnagar was about the worst administered State in the peninsula. The Thakore taxed his unfortunate people to the last possible *pie*, spending the hardly-wrung revenue, firstly, on the price of immunity from annexation which he paid in the form of tribute to the Government; and secondly, on the selfish and indolent pleasures so dear to the Oriental mind. The history of the State of Dilnagar to some extent accounted for the grasping character of its rulers. Gholam Singh and his family were not indigenous to the soil. He was third in succession to Feroz Singh, a warrior chieftain from the north, who had conquered the country some time about the commencement of the century, only to find that the prize was not up to expectation. The then ruler of Dilnagar was captured and slain by Feroz Singh; but the vast treasure with which the palace was accredited was never discovered, having been concealed just before the entry of

the enemy, in some inaccessible hiding-place, by the Vazir Khanji, prime-minister and chief officer of the household. The Vazir himself was supposed to have fallen in the conflict which resulted in the taking of the city, and with him had apparently perished all chance of ever discovering the whereabouts of the treasure. Those who know the ways of Eastern conquerors will understand that the absence of spoil which was known to exist did not improve the lot of the conquered. Feroz Singh did his best to make up the deficiency by oppressing the people; and his descendants were faithful followers of his example.

His Highness the Thakore received Heygate in semi-state; that is to say, the audience was given in what he called his 'presence chamber,' an apartment furnished with a mixture of real Oriental magnificence and second-hand European goods, bought cheap at some sale in Bombay. He emphasised the unofficial nature of the reception by lying at full length during the interview on a common iron bedstead, which was covered with silken cushions of rare workmanship; and while Heygate was preferring his request for military employment, he played cup and ball diligently. But before he had said a dozen words, Heygate knew that his petition was to be granted. The air of insolent indifference which Gholam Singh chose to wear towards an Englishman not in Government service failed to hide a triumphant sparkle in his lazy eyes at the idea of possessing this well-knit young officer for his own. As Heygate painted in his best Hindustani a glowing picture of what the Dilnagar troops would become under his tuition, successful efforts at cupping the ball became less frequent, and finally the Thakore flung the toy aside and listened unaffectedly. Basil Heygate was a new plaything worthy of attention, after all.

'Your Highness would thus acquire an army, small perhaps in numbers, but one which in discipline and drill would put to shame the forces of Scindiah, Holkar, and the Nizam,' concluded the applicant, who was nothing if not thorough.

'My friend, say no more. I appoint you from this hour to the post of Chief Sirdar of my army. No man who serves Gholam Singh has cause to complain of his master's generosity, and you shall have free quarters in the palace with a salary of two hundred rupees a month,' said the Thakore with the air of a man who was doing a noble deed. The sum he offered to his new 'general' was less than the pay of a lieutenant in the English service; but it would be enough, Heygate thought, in a native city, where there were no social duties and no style to keep up.

'Rajab,' proceeded the Thakore, addressing one of his ministers, 'assemble such of the body-guard as are on duty in the courtyard, so that the Sirdar may see his new command.'

The Thakore proceeded to a window, followed by Heygate and by the other more or less disreputable-looking members of his suite. In a few minutes some fifty men entered the courtyard below, and 'fell in' in a manner which suggested that they had heard of such a thing as drill, if they had never seen it. The attempted imitation of civilised troops was further accentuated by the use of English words of command, which the native havildar in charge shouted

parrot-like without knowing a word of the language he borrowed from. The men were well-built sturdy fellows enough, but uniform was unknown among them. Some few wore the ancient chain-mail in which the Saracens fought; others were dressed in scraps of old European regimentals; those who had tunics not wearing trousers, and *vice versa*; but the majority were in native costume, ragged, and none too clean. They were all armed with matchlocks about seven feet long. The effect of the operation which their officer called 'Shudder humps' with these pieces was so ludicrous that Heygate smiled.

'I understand that Your Highness has purchased European uniform for the men,' he said. 'That will greatly improve their appearance.'

'Yes,' replied Gholam; 'I have well nigh depleted my treasury to do so.'

'If I am to do justice to your patronage,' continued Heygate, 'the men should be furnished with modern rifles, or at anyrate with percussion muskets. A soldier-like appearance while they are armed with those matchlocks is out of the question.'

To the young officer's surprise, his suggestion threw the Thakore into a state of hysterical rage and excitement. He took off his turban and tore his hair; he spat upon the floor and flung his arms over his head; and all the while he bewailed his unhappy lot in having been cheated of what he considered his patrimony by the failure of his ancestor to unearth the plunder of Dilnagar. Here, he moaned, he had set his heart on having a smart body of troops round him; he had ordered a bargain in second-hand uniforms, and a brilliant Sirdar had been engaged; but the whole project was to be spoiled because he had not money enough to buy rifles. His Highness, in fact, comported himself after the manner of a thwarted Oriental potentate, which is very much the manner of a thwarted child. When he became calmer, he dilated to Heygate upon the circumstances of his enforced poverty, and finally dismissed him to quarters which he ordered to be prepared for the new Sirdar. The Thakore closed the interview with an intimation that Heygate's duties would commence on the morrow, when there would probably be entrusted to his care a scheme for providing the bodyguard with muskets or rifles.

For the first time in his life the young Englishman salaamed to what a month before he would have called a 'dirty nigger,' and retired. He had already conceived a wholesome contempt for his master, but, on the whole, he was satisfied with his day's work. At anyrate he had obtained what he came for, and though that was not much, it was the means of earning his livelihood in a profession he understood. Far better than walking about the streets of London penniless in search of employment which was sure to be uncoungeal. Thus he ruminated as he discussed his first meal under Gholam Singh's roof in one of two large but barely-furnished apartments that had been assigned to him. The bedroom contained nothing but a common native 'charpoy,' not nearly so good a one as that on which his own kitmutghar had slept; and the sitting-room boasted only a rickety table and two chairs; but the curried fowl was well cooked and

decently served—a fact which prevented the tired traveller from indulging in too gloomy comparisons between his present quarters and his luxurious bungalow at Mhow.

Heygate's reflections were interrupted by the entry of Rajab, Gholam's prime-minister and general factotum. Rajab was short and stout, with a cunning twinkle in his eye that suggested an entire want of principle, relieved by a dash of droll humour. If he set himself to cheat any one, as in truth he did very often, he would do it with an air of facetious relish, as though he cheated not for gain but for the sake of having his little joke. He saluted Heygate politely, and seated himself in the other chair.

'I bring your orders, Sirdar, for to-morrow,' he began. 'His Highness desires you to take two hundred men and to march to Dhoonghar, thirty miles north of this city. The Begum Luxmeebhai of that place is in arrear with her taxes—luckily for our little project—and you will therefore drive off all her flocks and herds, and also bear off anything of value in the Begum's house. She is reputed rich, and you should return well laden. This plan will save both her and ourselves trouble in computing the exact amount of her arrears, and it will moreover give His Highness the means of purchasing the rifles which his soul desires.'

Heygate listened horror-struck. To head a band of marauding cattle-lifters and to plunder a helpless woman was as impossible to him as to hang the Begum Luxmeebhai on the nearest tree. In his ignorance of the manners and customs of native States, he had supposed that the only function of the 'troops' was to minister to the sense of ostentatious pride to which the protected rulers cling so closely, and his mistake was a revelation to him. He had forgotten that here in his own dominions the Thakore was paramount, and that the wail of the oppressed could easily be stifled ere it could reach the Supreme Government from the wilds of Kattiawar.

Of course he recognised that there was an end of his project at once. His reply was an indignant refusal. 'Tell the Thakore,' he said, 'that he must get some one else to do his dirty work. I did not come here to act as chief cattle-stealer to His Highness. I shall return to Bombay at once; and I will take care that the Government is notified of the way in which the State of Dilnagar is administered.'

Rajab smiled lazily. 'My young friend,' he said, 'do not be rash. His Highness has taken a fancy to you, and most assuredly you would find departure in your present frame of mind a difficult matter.'

'Pshaw!' said Heygate; 'Gholam Singh knows better than to molest an Englishman. I am quite willing to take all risk on that head.'

'Pardon me, my young friend; you are impetuous,' answered Rajab. 'I did not say that you would be molested. I merely intended to convey the hint that here in Dilnagar those who offend His Highness have a bad time of it. Nothing brutal, you know; the days of the bowstring are past. But a pinch of powdered glass or of something stronger in one's food; a quiet prod from a knife on that lonely road between here and Verawal—why, there are a hundred ways of doing it! You understand me, I see.'

Heygate did understand. The price of refusing the post he had so eagerly sought would in all probability be secret assassination, carried out so skilfully that the cause of his death would never be known. But he wavered not for an instant.

'Go and tell your master,' he repeated, 'that I leave for Bombay to-night. Let him touch me at his peril.'

'I will go; but I will give you an hour to think of it before I report to the Thakore. This is unfortunate, and might have been prevented had the Fakir Indrajī not taken it into his silly old head to die this afternoon. We had hoped to get some hint from him, by force if necessary, as to the whereabouts of the secret treasure. He was the only man in Dilnagar old enough to remember the sack of the city.—Think better of your resolve, my brave friend!' and with a courtly bow the plausible Rajab departed.

The news of the Fakir's death did not surprise Heygate, and he had other matters to think of. His best plan would be to start at once before the hour's grace was up, and get as far as he could on the road to Verawal before Gholam had heard of his defection. Thank goodness, he had his revolver, and he would sell his life dearly if any hired ruffians attacked him by the way. Putting his hand in his pocket to see if the pistol was safe, his fingers came in contact with the quill which the Fakir had given him earlier in the day. Now that the old man was dead, he remembered that he was at liberty to open it, and, idly curious as to what he should find inside, he broke the seals. A tiny scrap of discoloured paper covered with Guzerati characters rewarded his search. It was lucky for Heygate that his studies with a view to securing a Staff appointment had included a smattering of the language. With amazement gradually dawning into appreciation of the vast importance of the paper, this is what he read :

'I, the Vazir Khanji, in future to be known as Indrajī the Fakir, write this. The hosts of the conquering Feroz are at hand. I have builded up the treasure in the city wall in order to save it from his despoiling hands. The stone in which my shackle is fixed is the key of the hiding-place. Remove the stone, and the wealth of Dilnagar will be found. While I have life, I guard it from the extortioner. When I die, it shall belong to whomsoever I shall give this paper.'

So the aged Fakir stood revealed as none other than the Vazir Khanji, who nearly seventy years before had sat him down in this mean guise to guard his slaughtered master's wealth from the invader. What a record that brief paper held of fidelity to his self-imposed trust! And to think that he, Basil Heygate, had chanced upon the old man in his need, and had thus become possessed of information which would mean the difference between life and death to him. Well he knew he could never disinter the hidden hoard from the city wall unaided, but at least it would enable him to make terms with the Thakore, which would get him safely out of the country, and at the same time benefit the unhappy inhabitants by relieving their ruler's exchequer.

Heygate's action was prompt. He sent his attendant for Rajab, and astonished that official

with the news that the secret of the treasure was known to him, of course suppressing any allusion to Indrajī. The terms he offered to Gholam were these: in order to insure his own safety against any treachery, he would communicate with the authorities in Bombay as to his whereabouts, asking that Gholam Singh might be held accountable if he did not return in a given time. On receipt of a reply, he would divulge the hiding-place of the treasure on condition of receiving one-tenth part of the value. This arrangement he insisted on having under Gholam's own signature; and he enclosed it with his letter to Bombay—only to be opened in case of his non-return. He had no fear as to the safety of his letter, as the Thakore was in much too great a hurry to finger the spoil to put any obstacle in its way, and as long as Heygate alone knew the secret he was safe.

In ten days an acknowledgment of the letter arrived. Within an hour Heygate conducted the Thakore and his ministers to the spot where the man they had known as Indrajī had sat so long. The ring which had encircled the Fakir's neck had been cut through in order to remove the body, but the stump of the staple still projected from the wall.

'There!' said Heygate. 'Remove that stone, and your quest will be at an end.'

The masons whom they had brought set to work with a will; and as the crowbars chinked and the great stone began to show signs of moving, the young man's excitement was almost painful. What if Indrajī's story was a fiction, after all? Even the fear of the Government would hardly save him from the Thakore's first burst of disappointed rage. But relief came at last; the great stone moved, and toppling forward revealed a sight which struck the bystanders dumb with astonishment. There, in a vast hollow, of which the stone had been merely the doorway, were piled vessels of gold and silver, heaps of precious stones and glittering gems, which had broken loose from the rotting bags that had contained them, an avalanche of gold mohurs that had been apparently shovelled in like chaff, and several chests which spoke of still richer treasures to be explored. Heygate had hardly given a thought to his stipulated tenth share hitherto, expecting at the most a few thousand rupees, welcome but not omnipotent. Now he knew that a tithe of all that shining wealth would save his career, and send him back to the regiment he loved so well with more than enough for his needs.

Three days later, when the hoard had been valued, Heygate was escorted to the city gate with much pomp by the Thakore in person. In his knapsack he had a draft on His Highness's Bombay agents for seven lacs of rupees—the equivalent of fifty thousand pounds. Arrived at the memorable archway, the final parting took place. 'I hope,' said the retiring Sirdar, 'that Your Highness will not now find it necessary to harry the Begum Luxmeebhai or any of your subjects. The Government would be sorry to hear of it.'

To this diplomatic hint Gholam Singh replied suavely enough: 'I am a beneficent ruler, my friend; my people will participate in the wealth

you have brought us. Thanks to you, Dilmahgar will be a paradise of content.'

But a subterranean scowl struggled bravely with the smile on His Highness's face; and as Heygate turned his horse's head for the road along which he had tramped footsore and sick at heart three weeks before, he thought with satisfaction of the letter and agreement lying at Bombay. They stood between him and—well, His Highness the Thakore's pleasure.

BLACK LABOUR IN QUEENSLAND.

THE Bill which has lately been passed by the Legislature in Queensland permitting a renewal of the importation of South Sea Islanders, or Kanakas, for employment on the sugar plantations, has caused a good deal of discussion in England both in the Press and in Parliament. Not unnaturally, the fear has been expressed that a repetition might occur of the abuses which took place prior to the Commission of 1885, in connection with the recruiting of coloured labourers, and that, if the measure passed unchallenged by England, it might be thought her approval was being given to a scheme which has in some quarters been denounced as little better than slavery. The facts of the case, however, show not only that black labour is absolutely necessary in Queensland, unless the sugar industry is allowed to die out, but that the hiring of Kanakas has for years past been conducted under stringent regulations, laid down by the Queensland Government, requiring that ships carrying immigrants shall be licensed, and providing that agents shall be on board to see that 'all islanders have voluntarily engaged themselves, and have entered into their agreements with a full knowledge and understanding of their nature and conditions.' There is evidence, however, that the rules laid down have not in some cases been sufficiently observed. Under the new Act, therefore, they have been made still more severe; and as the Queensland Government seem determined to see them carried out, and to punish any infringement of them, there is no reason to apprehend that the reintroduction of black labour will not be properly conducted. As regards the treatment of the Kanakas when on the plantations, recent testimony, which I can confirm from my own observation in the colony, shows that they are well housed and fed, receive a fair wage, and when their time is up, return to their homes with some money in their pockets, unless, indeed, they have spent it in bright-coloured clothes and handkerchiefs, for which they have a weakness.

The causes which have led to the reintroduction of black labour into Queensland are not far to seek. The tropical heat, although necessary for the growth of the sugar-cane, renders field-labour by the white man so unpleasant, that he will not submit to it, at all events at such wages as the planters can afford to pay. So far, well enough; but the white man in attempting to exclude the necessary Kanaka, and thus adhere to the political cry of 'Australia for the white man'—under which the present Premier, Sir Samuel Griffith, came into power—has almost destroyed one of the most important industries in Queensland. Fortunately, however, the folly

of this policy has now been perceived; the edict against the black man has been withdrawn, and, according to recent accounts from the colony, the sugar-planters, whose estates were going out of cultivation, are again putting forth their energies, and a new era of prosperity may fairly be anticipated.

The exclusion of the Kanaka, so far from being in the interest of white labour, has proved exactly the contrary, for statistics show that the decrease in the numbers of coloured labourers has been followed by a decrease in the same ratio in the employment of white men. According to Mr W. A. Ackers of Townsville, there were seven thousand coloured men employed in 1886 in the Mackay district of Queensland, and eight thousand white people; while in 1888, when the number of coloured men had been reduced to two thousand, the white men employed numbered only four thousand, being a decrease of fifty per cent. in two years. According to the same authority, the wages paid to the Kanakas throughout the colony in 1888 amounted to between fifty and sixty thousand pounds; whereas during the same period the white men employed either directly or indirectly in connection with the sugar industry received as much as one hundred and seventy-four thousand pounds.

The interests involved are of some magnitude. In 1887 the capital invested in this industry was five million pounds, and the value of the machinery for the production of sugar was one million pounds. One quarter of the total area under cultivation in Queensland was under sugar-cane. The value of sugar exported in 1888 was eight hundred thousand pounds; and of the sugar consumed in the colony, two hundred thousand pounds, giving a total of one million pounds. In 1890 the value of sugar exported had diminished by one hundred thousand pounds—the result of the policy above described. As the reintroduction of suitable labour, now resolved upon, means the continuance of an industry of these proportions, the subject is of considerable importance as regards the future prosperity of Queensland.

MARGUERITE.

SHE lingered 'midst the lilies white and fair,
Marguerite,
Herself the fairest flower that blossomed there,
Pure and sweet.
The music of her voice came unto me
Soft and low;
She sang of happy days that were to be
Long ago.

It was a golden dream of Hope and Love,
Born but to die.
The lilies drooped their heads; the storm-clouds came
Across the sky.
And I have wandered on through weary years,
Life's music fled,
Since my fair Love, my little gentle flower,
Lay dead.

THREE AUSTRALIAN BOOMS.

In all countries accustomed to the ups and downs of mining ventures, the news of a large find of either gold or silver causes the most intense excitement. The mere rumour of a rich discovery at any place is sufficient to send hundreds of the Bedouin population of the mining districts flocking to the spot. These seem always ready to flit on the shortest notice to other fields, always ready once more to try their luck in a fresh gamble with Nature. So they wander about from field to field, sometimes making money, more often losing it; seldom, very seldom keeping it when made. In no part of the globe is this more constantly seen than in the Australian colonies. The Australians are indeed a gambling community, always ready for a 'plunge,' whether it be on the almost daily horserace or the last-discovered Eldorado. Wages are high, so the working-man has usually a few pounds to spare. The generality of them cannot resist the temptation to try their luck at the game which has made so many of their employers rich. The successful speculator is always 'en évidence,' an object of envy to some, and a lure to others. The ruined gambler sinks out of sight, and the lesson he might teach is never learned.

When the Broken Hill silver mines were first discovered, and it had been satisfactorily proved that silver really existed in payable quantities, half the population of Australia went 'silver mad.' The land round Broken Hill was pegged out into claims to the extent of thousands of acres. Companies were started by the score, many of them with barely sufficient capital to pay the expenses of sinking a hundred-foot shaft or driving a moderate adit. Every one bought scrip; shares rose at the rate of pounds daily. The clever ones realised fortunes and sold out; the majority held on for that little bit more which all men want, and in many cases lost all. A few of the lodes when properly opened up turned out enormous quantities of silver, and, until the present strikes, paid large dividends. The ma-

jority of the companies have now collapsed, others barely pay working expenses.

Some curious stories are told of fortunes made or missed at this time. One prospector was sinking along the line of a lode which ran through his claim. As he went down, he found the lode kept constantly widening and then 'pinching' again, an almost certain sign that it would soon die out. He therefore sunk till the lode widened again, and then sold his claim for a few hundred pounds, very pleased at having, as he considered, got a very good price for a very bad article. It is only natural to suppose that his guileless joy was not so keen when he heard that the claim had turned out one of the best on the field, worth in the market fully a million sterling.

The 'mining boom' was quickly followed by a 'boom' in property. Mushroom land and building societies started in numbers. Town properties changed hands again and again at enormous prices. Very often no cash passed between buyer and seller, bills being taken in payment—in many cases never met. One block of buildings and the land on which they stood were sold to a speculator, who paid a small deposit, with permission to pull down the building and erect better ones, more suitable for the good time coming. The old material was hardly off the ground before the 'boom' collapsed; the purchaser could not meet his engagements, vanished; and the unfortunate seller found himself with his property once more on his hands, but minus the buildings.

In the meantime prospectors from Broken Hill had gone to the west coast of Tasmania, where silver had, it was believed, been found in the early days of the convict occupation. These men went through almost incredible hardships. The country was covered either with dense bush or button-grass swamp. Riding was impossible. All their provisions had to be carried on their backs; their blankets, wet through by day, were often their sole covering at night. However, their efforts were rewarded, outcrops of ore

being found in all directions. The first lode worked in the neighbourhood of Mount Zeehan gave very good results. A company (the Silver Queen Company) was formed with fifteen thousand pounds capital, which was all called up and expended in sinking and machinery. Within a few months this mine had yielded such a large amount of both argentiferous galena and kaolin ore, that the directors found themselves able to declare two dividends.

A gigantic rush now set in for the field from all the surrounding colonies. Within the next two years, over fifteen hundred eighty-acre claims had been pegged out. Manganese and other outcrops, indications of silver beneath, were discovered in large numbers. Nearly two hundred companies were formed in Hobart alone, others in Zeehan and Melbourne. Roads were made by the Government; also a railway commenced by them from the port of Strahan to the town of Zeehan, which had commenced to spring up as fast as building materials could be put on to the ground. A number of large hotels were built, and no sooner built than crowded—three people often sleeping in a tiny room, others in the bar, on the tables, anywhere. Zeehan, from a small collection of huts, burst into a town of some thousands of inhabitants, boasting of gas and water companies, two Stock Exchanges, a perfect posse of hotels, shops with large plate-glass windows, churches, banks, a town hall and a corporation. Three private railway companies were formed, and very soon commenced work. In the vicinity of Mount Dundas, seven miles from Zeehan, rich discoveries of ore were made; and the market value of some of the mines, judged by the price of the shares, exceeded two hundred thousand pounds sterling, with a keen demand. All the road frontage between Zeehan and Dundas was pegged out into building allotments; had these been built on as intended, the houses would have formed a street as long as from Battersea Bridge to Liverpool Street.

Everything looked prosperous, and the gambling in mining scrip in all parts of the colonies raged more furiously than ever. The country surrounding the lodes (generally dark slaty rocks), the quality of the ore, the general direction of the lodes, all seemed to point to a successful issue. In one of the Dundas mines (the Central Dundas) the writer himself saw a lode which had been cut through ninety feet wide, of black gossan, thickly covered with chlorides, which sparkled like diamonds in the light of our candles. The streets of Zeehan at this time presented a curious, busy appearance, swarming with people of every trade and nationality: miners in their muddy garments, stockbrokers, speculators, visitors, and mining experts (these last quite ready to give excellent Reports about anything provided payment was in proportion), telegraph boys, drays laden with timber, horses with silver ore—all splashing through the mud, and continually passing and repassing up and down the narrow, dirty street. Ore was now being raised in tons and stacked, ready to send away to be smelted when the railways were opened. Men who had made fortunes at Broken Hill came to Tasmania, gave it as their belief that the lodes were 'true fissure,' and backed up their opinion by investing largely in shares. But one doubt was expressed, and this

only by the most cautious—that the enormous output of silver would lower the price of the article so much as to leave no margin for profit.

Suddenly, when things were looking almost at their best, and people were prophesying that the 'boom' had hardly begun, the Bank of Van Diemen's Land closed its doors, forced to do so by the united jealousy of other commercial institutions. Then followed other banks and building societies in Melbourne. These suspensions soon brought the mining shares down to their proper value, which was in many cases nothing at all, dear at the price of the paper they were printed on. The bank being closed, no money was forthcoming to pay calls, so numbers of the mines had to shut down for want of capital. In others, work had never been started, and all the funds were found expended in salaries to men with nothing to do. Other lodes pinched out, or were 'driven' for and missed, owing to 'faults' and other eccentricities of Nature. Gradually mine after mine closed down; the swarm of adventurers who had flocked to the field drifted away to other finds, those only remaining who could not get away through want of funds, or who were connected in some way with the few mines which still were kept working, generally by English capital. Twelve months since, Zeehan and Dundas were rapidly-growing towns, with every prospect of having between them in the future over one hundred thousand inhabitants. Now, most of the hotels are empty, the houses in many cases abandoned by their owners, only a few mines working with hope long deferred, and the furor has died out. All the 'bitten ones' have for consolation is probably a bundle of valueless mining scrip, which they may perhaps occasionally turn over, regretting sorrowfully that they did not sell out during the boom, which they still fondly hope may come again.

BLOOD ROYAL.*

CHAPTER XV.—A WILLING PRISONER.

AT Oxford all that day, Mr Archibald Gillespie of Durham College found himself in a very singular position indeed for an undergraduate of such unquestioned and respectable manners. For he was keeping Maud Plantagenet shut up behind a sported oak in her brother's rooms, and clandestinely supplying her with lunch, tea, and dinner!

This somewhat compromising condition of affairs in the third pair left of Back Quad New Buildings had been brought about by a pure concatenation of accidents. When Maud left Chiddingwick that morning, with nothing in her purse, she had trusted to Dick to supply her with the wherewithal for paying her way back again. But as Dick was not at home when she reached his rooms, she had been compelled to wait in for him till he returned from Chiddingwick. For the same reason, she was obviously unable to supply herself with food at an hotel or restaurant. Being a Plantagenet, indeed, she

* Copyright 1892 in the United States of America by the Cassell Publishing Company.

would have been far too proud to let Gillespie suspect these facts by overt act or word of hers: but somehow, he guessed them for himself, and soon found his suspicions confirmed by her very silence. Now, the scouts or college servants have a key of the 'oak,' and can enter men's rooms at any moment without warning beforehand. There was nothing for it, therefore, but for Gillespie to take Dick's scout frankly into his confidence; which he did accordingly. Already, he had forgotten his eleven o'clock lecture; Plato's *Republic* had gone to the wall before a pretty face: and now, he went outside the door to plot still further treason, and shouted, after the primitive Oxford fashion, for the servant.

'Look here, Robert,' he said, as the scout came up, 'there's a young lady in deep mourning in Mr Plantagenet's rooms. She's Mr Plantagenet's sister, and she's come up to see him about this dreadful affair the other day, you understand. But he's gone down home for the morning to Chiddingwick—they've crossed on the road—and he mayn't perhaps be back again till late in the evening. Now, I can see the young lady's got no money about her—she came away hurriedly—and I don't like to offer her any. So I'm going to telegraph to Mr Plantagenet to come back as soon as he can; but he can't be here for some time yet, anyhow. Of course, the young lady *must* have something to eat; and I want you to help me with it. Tell the porter who she is, and that she'll probably have to stop here till Mr Plantagenet comes back. Under the circumstances, nobody will say anything about it. At lunch-time, you must take out something quiet and nice in my name from the kitchen—chicken cutlets, and so forth—and serve it to the young lady in Mr Plantagenet's rooms. When Mr Plantagenet returns he'll see her out of college.'

As for Robert, standing by obsequious, he grinned from ear to ear at the obvious prospect of a good round tip, and undertook for his part with a very fair grace that the young lady's needs should be properly provided for. Your scout is a person of infinite resource, the most servile of his kind: he scents tips from afar, and would sell his soul to earn one. Even in this age of enlightenment, however, an Oxford college still retains many traits of the medieval monastery from which it sprang; women are banned in it; and 'twould have been as much as Mr Robert's place was worth to serve the unknown young lady in Dick Plantagenet's rooms without leave from headquarters. So he made a clean breast of it. Application to the Dean, however, resulted in his obtaining the necessary acquiescence; and Gillespie devoted himself through the rest of that day to making Maud as comfortable as was possible under the circumstances in her brother's rooms till Dick's return from Chiddingwick. So charitably was he minded, indeed, that he hardly left her at all except at meal-times. Now, in the course of a long day's *tête-à-tête*, two people get to know a wonderful deal of one another, especially if they have mutually sympathetic natures; and before Dick returned that evening to set Maud at liberty, she and Gillespie felt already like old friends together.

Dick didn't get back, as it happened, till long after Hall; and then it was too late for Maud to catch a train back that evening. The reason

for the delay was simple: Dick hadn't received Archie Gillespie's telegram till his return from the rectory. He had stopped there to lunch, at Mrs Tradescant's request, after his interview with Mary; and for Mary's sake he thought it best to accept the invitation. So the end of it all was that Dick had to find his sister a bed under the friendly roof of a married Fellow of his college; and that before he took her round there, he, she, and Gillespie had a long chat together about the prospects of the situation.

'Mr Gillespie and I have been talking it over all day, Dick,' Maud said very decidedly, 'and we're both of us of opinion—most distinctly of opinion, that you oughtn't, as a duty to mother and to us, to do anything that'll compel you to take back again the one great forward step you took in coming to Oxford. Mr Gillespie says rightly, it's easy enough to go down, but not by any means so easy, once you're there, to climb up again.'

'I ought to do whatever makes me earn an immediate income soonest, though, for all your sakes, Maud,' Dick objected stoutly.

'Not at all!' Maud answered with Plantagenet decision, and with wisdom above her years, dictated no doubt by her love and pride in her brother. 'You oughtn't to sacrifice the future to the present.' Then she turned to him quite sharply. 'Did you see Mary Tudor to-day?' she asked, regardless of Gillespie's presence, for she considered him already as an old friend of the family.

The tell-tale colour rushed up fast into Dick's cheek. 'Yes, I did,' he answered, half faltering. 'And she behaved most nobly. She behaved as you'd expect such a girl to behave, Maud. She spoke of it quite beautifully.'

Maud drew back, triumphant. If Mary had been there, she could have thrown her thin arms round her neck and kissed her. 'Well, and *she* didn't advise you to go and settle at Chiddingwick!' Maud cried with proud confidence.

'She didn't exactly *advise* me,' Dick answered with some little hesitation; 'but she acquiesced in my doing it; and she said whatever I did, she'd always love me equally. In point of fact,' Dick added, somewhat sheepishly, 'we never were engaged at all before to-day; but this morning we settled it.'

Maud showed her profound disappointment, nay, almost her contempt, in her speaking face. To say the truth, it's seldom we can any of us see anything both from our own point of view and some one else's as well. Maud could see nothing in all this but profound degradation for Dick, and indirectly for the family, if Dick went back to Chiddingwick; while Mary had only thought how noble and devoted it was of her unselfish lover to give up everything so readily for his mother and sisters.

'I think,' Dick ventured to put in, since Mary's reputation was at stake in Maud's mind, 'she was most—well, pleased that I should be willing to—to make this sacrifice—if I may call it so—because I thought it my duty.'

Maud flung herself on the floor at his side, and held his hand in hers passionately. 'Oh, Dick,' she cried, clinging to him, 'dear Dick! she oughtn't to have thought like that! She oughtn't to have thought of *us*! She ought to

have thought, as I do, of you and your future! If I, who am your sister, am so jealous for your honour, surely she, who's the girl you mean to marry, ought to be ten times more so!

'So she is,' Dick answered, manfully. 'Only, don't you see, Maud, there are different ways of looking at it. She thinks, as I do, that it's best and most imperative to do one's duty first; she would give me up for herself, almost, and wait for me indefinitely, if she thought I could do better so for you and dear mother.'

Maud clung to him passionately still. For it was not to him only she clung, but also to the incarnate honour of the family. 'Oh, Dick,' she cried once more, 'you mustn't do it; you mustn't do it; you'll kill me if you do it! We don't mind starving; that's as easy as anything; but not a second time shall we draggle in the dust of the street the honour of the Plantagenets.'

They sat up late that night, and talked it all over from every side alternately. And the more they talked it over, the more did Gillespie come round to Maud's opinion on the matter. It might be necessary for Dick to leave Oxford, indeed; though even that would be a wrench; but if he left Oxford, it would certainly be well he should take some other work—whatever work turned up—even if less well paid, that would not unclass him.

And before they separated for the night, Maud had wrung this concession at least out of her wavering brother, that he would do nothing decisive before the end of term; and that, meanwhile, he would try to find some more dignified employment in London or elsewhere. Only in the last resort, he promised her, would he return to Chiddingwick—and his father's calling. That should be treated as the final refuge against absolute want. And indeed his soul loathed it; he had only contemplated it at first, not for himself but for his kin, from a stern sense of duty.

Gillespie saw Maud off at the station next morning with Dick. He was carefully dressed, and wore, what was unusual with him, a flower in his button-hole. Maud's last words to him were: 'Now, Mr Gillespie, remember; I rely upon you to keep Dick from backsliding.'

And Gillespie answered, with a courteous bow to the slim pale little creature who sat in deep mourning on the bare wooden seat of the third-class carriage (South-eastern pattern): 'You may count upon me, Miss Plantagenet, to carry out your programme.'

As they walked back together silently up the High towards Durham, Gillespie turned with a sudden dart to his friend and broke their joint reverie. 'Is your sister engaged, Dick?' he asked with a somewhat nervous jerk.

'Why, no,' Dick answered, taken aback—'at least, not that I ever heard of.'

'I should think she would be soon,' Gillespie retorted meaningly.

'Why so?' Dick inquired in an unsuspecting voice.

'Well, she's very pretty,' Gillespie answered; 'and very clever; and very distinguished-looking.'

'She is pretty,' Dick admitted, unsuspecting as before. No man ever really remembers his own sisters are women. 'But, you see, she never

meets any young men at Chiddingwick. There's nobody to make love to her.'

'So much the better!' Gillespie replied, and then relapsed into silence.

(To be continued.)

LONG-DISTANCE RIDES.

THE recent performances of German, Austrian, and Hungarian horsemen perforce invite comparison with former feats of a similar kind; and of these, as far as authentic records allow comparison, Britain has almost the monopoly. The accomplishment, between Berlin and Vienna, of journeys which varied, according to the route chosen, from three hundred and sixty-one English miles to over four hundred, in any time less than eighty-five hours, exhibits the men who took part in the tremendous race as active and untiring riders, if not as horsemen. It is hardly necessary to observe that between a 'good rider' and a 'good horseman' there is a wide and important difference; the former term implying strong seat and light hands only, while the latter indicates in addition the rider's intimate knowledge of his mount, and ability to get out of him the last ounce without inflicting injury. In the majority of cases, the Austrian and German officers proved themselves bad horsemen; the horse ridden by Count Starhemberg, the winner, died of exhaustion the day after its arrival at Berlin; the Irish mare upon which Baron Reitzenstein won the second place, fell from sheer fatigue as soon as her rider dismounted, and could not be induced to rise for several hours; while at least five other competitors literally rode their horses to death. These disasters, repugnant to feelings of humanity, indicate the inability of the riders to measure the endurance of their mounts. Any man who can keep in the saddle can ride a horse to death. His sole requirements for the feat are a hard heart and a strong whip; but it requires a horseman in the highest sense of the word to get out of his animal in a given time the maximum quantity of work it can safely perform. The peculiar temperament and nervous system of the horse—the pluck which gives the thoroughbred his value—require careful study and attention. Other beasts of burden—the elephant, camel, mule, and bullock—are so constituted that no punishment will persuade them to go on when tired out; a well-bred horse, as every one knows, if pressed will gallop till he drops dead.

Foremost among English feats of horsemanship we have one which for generations has been represented in the circus ring. Dick Turpin's famous ride from London to York has taken its place among nursery legends; nevertheless, it was actually performed, and stands as a record of its kind. The highwayman, riding with the very best reason in the world—the safety of his neck—covered the distance of over two hundred miles in a little under twelve hours. This performance stands alone as the longest and fastest journey ever made on the same horse. Most of the long rides of which record exists have been made for wagers; such records are therefore

reliable. Squire Osbaldestone's undertaking to ride two hundred miles in ten hours, which he accomplished so successfully on the 5th of November 1831, is one of the most remarkable feats of endurance in the saddle, and has the merit of freedom from cruelty. The Squire rode his race on the Newmarket racecourse, changing his horse every fourth mile. Four miles is a safe limit for such a purpose, as that splendid horseman knew. Three-mile laps could have been covered in time relatively a little better; but a sound horse in fair training could do his four miles without distress in such time as to make that distance, with the consequent reduction in the number of changes, the most suitable for the purpose. Mr Osbaldestone used sixteen horses for his task, and rode standing in his stirrups like a jockey, while he kept his mount at best speed from start to finish of his four-mile heat, having quite a 'set-to' with his pacemaker at the end of each. The Squire was a hard man, and in good training, so suffered no bad effects from his exertions.

A most creditable performance by Australian Mounted Infantry, in April 1889, also deserves mention, as having been conceived and carried out in a truly sportsman-like spirit. The members of the Gympie Mounted Infantry having been out in camp for manoeuvres at a place called Lytton, near Brisbane, arranged to race home, a distance of one hundred and sixteen miles. With a discretion the German and Austrian executive had done well to copy, over-riding was provided against by the stipulation that no horse should win a prize if he arrived at the winning-post distressed, or in such condition that he could not do a further distance of ten miles. Eleven men, fully equipped in marching order, started from Brisbane at 2.40 P.M. on Wednesday the 23d April. The winner, Private Edwards, riding twelve stone ten pounds, arrived at Gympie at 2 P.M. next day, thus travelling the one hundred and sixteen miles in twenty-three hours and twenty minutes. The route lay over roads heavy from continuous rain, and included the crossing of a range of hills which threw out several of the competitors. The second man, Sergeant O'Neill, actually rode a better race than the winner, as his horse carried fourteen stone three pounds, and came in only a few yards behind Edwards'. The third and fourth men also arrived home within fifty yards of the winner. The horses ridden in this remarkable race were all thoroughbreds, and were in perfect training. It is hardly necessary to observe that a long course of preparation is essential to fit any horse for such a journey.

This Australian race has value as furnishing trustworthy data on which to estimate the travelling power of men and horses, for which purpose the Austro-German competition is absolutely useless. Every man who got home in the latter—and of the one hundred and nine Germans only seventy-two appear to have reached Vienna—brought in his horse in such a condition that if it did not succumb altogether, its career of utility was at an end: each unfortunate animal bore testimony that it had been taxed cruelly beyond its powers, and proved in its state not how far it could travel, but that it could not travel the distance asked of it and survive.

Our ancestors perforce made most of their

journeys on horseback until public conveyances became general, and, as might be supposed, long-distance rides against time were not uncommon. One conspicuous case has lately been unearthed by a descendant of the rider. Mr Thomas Cole, in 1614, rode from London to Shrewsbury, a distance of one hundred and fifty-four miles, in fourteen hours. He started from London at three o'clock on the morning of 4th August, and reached his destination before five o'clock the same afternoon. We are not told how often he changed horses; but the then condition of the roads, if they deserved the name at all, makes it certain that he did so with considerable frequency. As an example of sturdy endurance, this performance deserves a more prominent place in our records of horsemanship. We recall other feats of the same kind in the last century, but none quite equal to it.

Finally may be mentioned the brightest example of pluck and endurance in the saddle known to us—Captain Charles Townley's extraordinary journey on horseback from Belgrade to Constantinople in October 1849. This ride of eight hundred and twenty miles was not inspired by sporting motives; it was a race for life, not the rider's; a splendid response to the call of duty, and no more. How it came to be made is briefly told. It will be remembered that in the year mentioned the Hungarian War of Independence came to its bloody close, and the patriot Kossuth and many of his friends were compelled to seek in flight safety from the fate which threatened them as rebels against Austria. They made their way to Vidin, and there remained, trusting to the hospitality of the Turks. Austria and the Porte's hereditary enemy Russia demanded the surrender of the fugitives, threatening war if their demand were refused. The Sultan was disinclined to give up men he regarded, in a manner, as guests; but fear of Russia might have overcome his scruples, had the British ambassador, Sir Stratford Canning, not appealed to his sense of honour and dignity to stand firm. Sir Stratford Canning was a power at Pera, and the Turks had grown accustomed to look to him for guidance at critical times; hence, when the Czar pressed for a plain answer to his demand for the extradition of Kossuth and his compatriots, the answer dictated by Canning was 'No.' Russia and Austria forthwith recalled their representatives from the Turkish capital, and war seemed inevitable. Turkey, quaking with fear, turned to Canning; his advice had led her into the scrape; he should see her through it. Sir Stratford was not a man who did things by halves; the responsibility was tremendous, but he did not shrink. He took upon himself to promise that England would stand by Turkey in the struggle, and appealed to Lord Palmerston to ratify the promise without an hour's unnecessary delay.

In those pre-telegraphic days the 'Queen's Messenger' held a more responsible position in his country's service than he does now. As in this instance, the question 'Peace or War?' might be decided by his speed; and where railways did not exist, his speed often depended on his horsemanship. Thus, when Lord Palmerston looked about him for a man to convey his message of approval to Canning, he sought not

only one on whose energy and trustworthiness he could rely, but one who could turn to the very best account the means of travel available. He saw the right man in Captain Townley, a famous rider to hounds, and an intrepid soldier. Him, 'Old Pam' despatched with orders to 'spare neither yourself nor others.' On the 20th October the messenger left Belgrade, carrying the assurance of England's support. Despatches had already been sent by the Austrian Government to the Porte, and if these arrived before Captain Townley brought his, all might be undone. Everything was in favour of Austria's winning the race: three special relays of messengers were waiting at various points on the road to carry on the despatches, and if Townley meant to arrive first, his work was cut out. He proved himself equal to it in the teeth of difficulties which might well have pardoned failure. He had eight hundred and twenty miles to go, changing horses wherever and whenever he could; the roads, never of the best, were deep with mud, and he had to cross the Balkans at night in utter darkness. Twice, the horse he rode fell with him; and not half the journey had been covered when an old gunshot wound worked open and drenched him with blood. Save when he stopped to change horses, and once for six hours to sleep, he spent five days and eleven hours in the saddle, latterly almost fainting with fatigue and loss of blood. But he won his race: at half-past five on the morning of the 28th October, he reached the British Embassy at Pera, and learned that his magnificent performance had not been in vain. Sir Stratford Canning was enabled to announce that the British fleet had been ordered to the Dardanelles; and Austria and Russia, baffled, sullenly withdrew the demand they dared not attempt to enforce.

Without doubt, the horses used in this ride suffered severely. But how would it have fared with Captain Townley's mission had he been merely a bold and enduring rider, and not a horseman who knew exactly how far he might tax the powers of his mounts? He must have failed. Making 'the more haste, the less speed,' he would have ridden his first horse to death half-way through its stage, and would have found himself hopelessly 'thrown out.'

Long-distance rides in these days of universal railways are more in the nature of idle experiments than tests of equine endurance from which deductions of practical value can be drawn. Of late years, forced marches have been a somewhat prominent feature in the programme of work annually carried out by our own cavalry regiments, and these, by reason of the manner in which they are performed, are of genuine utility. To move a body of cavalry at such speed that on arrival at the point where its offensive services were required, the horses were exhausted, obviously would be the purest folly. And how far the average, not the best, horse can travel in a given time and arrive fit for further work after reasonable rest is a matter in which we cannot be too well informed. Such knowledge is gained only by experiment, and only experiments made by fairly large bodies of cavalry judiciously regulated command serious attention.

It does not come fairly under the heading of

this paper, but while dealing with the subject of horses' staying power, it may be of interest to mention that some Eastern nations who give endurance its full value, encourage its development far more practically than do we. General Sir Harry Prendergast told the writer that he was on one occasion present at a race-meeting held at Teheran at which the shortest race was eight miles and the longest twenty-four; the races he witnessed being quite the usual thing, and in no way exceptional in Persia. The bare suggestion of an eight-mile race would create a sensation at Newmarket; nevertheless, to ride it well would demand jockeyship of a higher order than our shorter races develop and to which we are accustomed in this country.

RALPH THORNLEIGH'S PICTURE.

CHAPTER IV.—CONCLUSION.

'ALTHOUGH the present Exhibition at Burlington House contains an exceptionally large number of works of unusual merit, we have no difficulty in selecting the picture of the year. Our choice falls without hesitation upon Mr Ralph Thornleigh's "Despair" (No. 357). This powerful work cannot fail to attract universal attention, and it is not easy to describe it without employing language which savours of exaggeration. It is long since such faultless technique, such mastery of colour, such ability to express emotion, have been discovered by an unknown artist. We do not recall having heard Mr Thornleigh's name before; but the painter of "Despair" will, we are confident, take his place ere long among the foremost portrait painters of the day. We shall watch Mr Thornleigh's career with interest.'

Colonel Stardale read it once; rose from the breakfast-table and read it again; then dropped the *Times* and his eyeglass together, and gave the bell a pull which brought his valet up-stairs four steps at a time.

'Hansom!' he gasped, almost before the door was opened, 'immediately!'

The man vanished; and Colonel Stardale picked up the newspaper to read 'The Royal Academy' column a third time. He had been to Burlington House once, just to say he had been there, and had read the press notices to be able to 'talk Academy' at dinner: but the season being now fairly under weigh, he had been too busy to spend more than a perfunctory half-hour at the Exhibition; and having no artistic proclivities, had spent the time talking to friends instead of studying pictures. He had not even entered the room where No. 357 hung, and had heard no mention of it until last night, when young Tripstone of the Guards asked him with a peculiar grin whether he had 'seen No. 357 at the Academy.' Mr Tripstone's remark recurred to him as he read the *Times* critique, and at the same moment it flashed upon him that Thornleigh was the name of the artist who made that fiasco of Miss Cairnswood's portrait. A horrible suspicion seized him, and he stepped into the hansom which awaited him, and drove the few hundred yards up to Piccadilly, looking very much disturbed.

He was soon standing, catalogue in hand, before

Ralph's masterpiece, which had caught his eye the moment he came into the room. The last shred of hopeful doubt was dispelled: No. 357 was the 'caricature' he had only a month since condemned to destruction in that garret off Holborn. Colonel Stardale honestly believed the picture a daub when he saw it on the easel; but now a strange feeling of awe came over him as he looked up at it. Beatrice stood, her head turned slightly to the left, wearing an expression he had never seen upon her face; her hands were clenched tightly before her, and the whole pose betrayed an agony of hopeless despair. Colonel Stardale was unable to remove his eyes from the face; he was anything but an impressionable man, but there was a something in the portrait which held him spellbound.

The voices of a party of early visitors brought him to himself, and he turned hastily away. 'What does it mean?' he wondered as he walked out through the turnstiles and down the stairs. 'This is terrible. Every one will recognise her, and she will be the talk of the town. I wish I had seen the picture destroyed at the time; but who ever would have dreamt of seeing in the Academy such a daub as it looked? Hung on the line, too! And held up to special notice by the critics! "Despair." What does it all mean? The chatter will be something awful.'

Colonel Stardale's prognostications proved correct. People who knew Beatrice—and the number of her friends had quadrupled since her engagement—saw No. 357, and exclaimed at once: 'Miss Cairnswood, by all that's mysterious; engaged to Colonel Stardale, you know; *she* can't have much to despair about!' There were a few who had known Ralph Thornleigh in his more prosperous days, and had observed the attention he was wont to pay Miss Macallan's pretty niece; and these were able to construct a neat and pathetic little story out of the materials at their command. It bore no resemblance to the true one, but that mattered nothing; it received general credence, and a fortnight after the Academy opened, the picture was the best-discussed subject in London. The striking talent of the artist was quite enough to make a sensation; and this, in conjunction with the engagement of the young lady to so well known a man as Colonel Stardale, made a dish which was served up daily in club and drawing-room and never palled.

The talk began, as usual, in whispers, increased to a murmur, and rapidly grew into a roar. People gave up pretending they did not know there was a story attached to No. 357, when the topic was broached before Colonel Stardale. He could go nowhere but before long some lady cornered him and begged him to 'explain.' In vain he would plead ignorance: in vain he declared Miss Cairnswood knew no Mr Thornleigh, and never in her life had given any artist 'sittings'; and equally in vain he tried to escape or turn the subject. Never a day passed but some new legend was brought to his unwilling ears to receive the stamp of his contradiction; he could go nowhere in comfort; he could find peace only in his chambers and at Warriston Square. Beatrice, who had been harassed even more unsparingly than himself, had given up going out altogether; and the Colonel saw ample

reason for her seclusion in the changed looks which indicated her indifferent health. The truth was Mr Macallan's difficulties were fast coming to a crisis, and his sister, resolutely closing her eyes to the physical injury she was doing her niece, worried her unceasingly to take the step which her calculations convinced her would rescue Messrs Macallan & Son from disaster. But no entreaties to name a day, a week, or even a month for the wedding, moved Beatrice; she ceased urging reasons and excuses for postponing the ceremony; and argue as she would, her aunt could wring no reply from her but that she did not wish to marry yet. The sensation her portrait caused had taken her utterly aback. She had known when she gave Ralph permission to exhibit the picture that she must be recognised; but she had lost sight of the fact that her engagement to Colonel Stardale gave her a far more prominent social place than she used to fill, and it had soon been borne in upon her that 'No. 357' had made her almost a public character: her daily walks had brought this home in a particularly distasteful form.

Nevertheless, there was a bright silver lining to the cloud. In her inmost heart Beatrice revelled in the thought that she had been the means of bringing her lover success. Hope sprang again into vigorous life, and hearkening daily as she did to numberless prophecies of name and fortune for Ralph Thornleigh, it was not wonderful that she refused to name the day for her marriage.

Her intended husband had never inquired if she could account for the curious character in which the artist had portrayed her; he shrank from alluding to the topic which had given him so much annoyance, but none the less he suspected in his fiancée's life the existence of a chapter he had not been permitted to read. He had privately questioned Miss Macallan; but that discreet woman knew nothing; she had never heard of Mr Thornleigh, and was quite sure Beatrice was equally ignorant. How could she? A poor artist who lived in an attic! The Colonel might depend that Miss Macallan's theory was right—namely, that this painter, who undoubtedly was a very clever one, had seen in the photograph the infinite possibilities offered by Beatrice's beauty, and had deliberately made a convenience of the Colonel's order to paint a sensational picture which should attract attention.

'Can you not take legal steps to force him to suppress the picture?' concluded Miss Macallan. 'I am sure you would be justified in punishing such scandalous audacity.'

But the Colonel shook his head; now the mischief was done, it would only aggravate matters to prosecute, even if the man had overstepped the law, which he thought exceedingly doubtful.

'I don't know what to say, I'm sure,' said Miss Macallan fretfully. 'I'm getting quite anxious about Beatrice, she is looking so pale and seedy. It's all worry, you know, Colonel; it's entirely owing to the scandal caused by this wretched picture.'

Colonel Stardale winced perceptibly at the word 'scandal,' but it seemed to convince him of the necessity for taking definite steps.

'We cannot allow it to go on,' he said decisively.

'You must take her away from town, beyond the reach of prating tongues, as soon as possible. Say to Brighton.'

Miss Macallan rose to the occasion instantly. 'I will tell Beatrice what you say, Colonel Stardale, and I'm sure when she learns it is your wish, she will go to-morrow.'

Beatrice, as her aunt well knew, would be the last to urge objections to such an arrangement; but her motives for desiring to leave town differed widely from those ascribed on her behalf. Temporary residence at Brighton, or at any spot distant from town, meant a definite reprieve for so long as that absence might last; and she embraced the proposal eagerly.

The Colonel breathed more freely when she had gone, for he had not enjoyed being seen with her latterly; to be mixed up in a scandal of this description with an obscure artist was intensely odious to him, and Miss Cairnwood's absence gave him a sense of greater independence and freedom. But he soon realised that her departure had done nothing to save him from the incessant questioning, whatever it had accomplished for her, and ere long that came to pass which he dreaded above all things. The Society papers took the matter up, and vied with one another in the publication of stories mendaciously sensational. The Colonel chafed miserably under it, but realising that he could do nothing to stem the flood, waited with what patience he might for it to subside.

But meantime the 'picture scandal,' as it had come to be called, flourished with a vitality that seemed indestructible, and at length the *Mayfair Gazette* brought forward a new story which roused the Colonel to action, unaware though he was that it trod heavily upon the heels of truth.

'We learn upon the best authority,' said the *Mayfair*, 'that Mr Thornleigh's now famous picture was painted under most romantic circumstances. The original of the portrait—who, as all the world knows, is Miss Cairnwood—was at one time engaged to be married to the artist. Misfortune threatening the relative upon whom Miss Cairnwood is dependent, the match was broken off; and it is more than whispered that the marriage since arranged for her with a gentleman well known in society is not wholly unconnected with that misfortune.'

This suggestive paragraph was scarcely in print before some considerate but anonymous friend brought it under Ralph Thornleigh's notice: theretofore he had ignored the various inventions with which the weekly papers regaled their readers, but now he also felt that the time had come to try to put a stop to them. Accordingly he called at the office of the *Mayfair* and requested an interview with the editor. He had some trouble in gaining admission to the sacred precincts of the editor's room; but once within its portals he lost no time in coming to the point.

'I have called,' he said, 'to ask you to favour me with the name of the person who furnished that story about my picture, published in your last number.'

The editor smiled pityingly. 'Quite impossible, Mr Thornleigh; absolutely against our rule to disclose the name of a correspondent.'

'But surely you acknowledge my right to demand the name,' returned Ralph warmly.

Again the editor smiled an aggravating smile. 'Absolutely impossible, sir,' he repeated blandly. '—But,' he continued, scenting useful 'copy,' 'no one is better qualified to deny the story—if it be untrue—than yourself, Mr Thornleigh. If you will deny it, I shall be most happy to publish anything you may wish to say.'

'I didn't come here to confirm or deny anything,' answered Ralph, with no little irritation; 'I want the name of the busybody who sent you the story.'

The editor's smile gave place to a look of lofty indignation. 'I must bid you good-day, Mr Thornleigh,' he said, rising from his chair and ringing the bell.

Ralph swept out of the office in a rage, and when he reached the street, pulled out the paper to read that paragraph again. 'I would have burned the thing ten times over rather than have brought this upon her,' he muttered. 'I only trust she may never see it.' Success whose fruits she would never share was scarcely worth achieving at any price, but purchased at the cost of annoyance to her it was worse than ignominious failure.

The editor of the *Mayfair* had another visitor that morning in the person of Colonel Stardale. The Colonel, more deliberate in his movements, but not less firm in his purpose, felt that justice to himself demanded inquiry. He had no difficulty in obtaining access to the editorial sanctum. The editorial doors flew open at the mention of his name; but the editorial breast refused to impart its secrets even to Colonel Stardale, for the simple truth was the editorial imagination had inspired the 'par.' in question. Colonel Stardale would not stoop to press for the information; but the editor was kind enough to volunteer a statement for which he was scarcely prepared—namely, that Mr Ralph Thornleigh had called a few hours ago on the same errand, and when the editor offered to publish a denial of the story, Mr Thornleigh had refused to deny it. On learning this, Colonel Stardale took up his hat and bowed himself out, leaving the editor to spend an unhappy afternoon in the pages of 'Barkin's Law of Libel.'

The Colonel left the office and walked back to St James's Street at once. He had a distinct purpose in mind, and acted upon it as soon as he reached his chambers. He sat down and wrote Beatrice a carefully-worded account of the *Mayfair's* story and his visit to that journal's office; he asked her to tell him frankly whether or no there were any truth in it. If she did indeed love another man, he would at once release her from her promise to marry himself, and never ask what had incited her to give that promise. He concluded by requesting her to regard his letter as confidential, and to deal openly with him; she would do him grave wrong to give him her hand without her heart.

It must be admitted that it cost the Colonel no great effort to write this letter. His nice sense of propriety had been cruelly lacerated; and his pride had been severely wounded by the *Mayfair's* thinly-veiled imputation that he owed his seeming conquest of Beatrice to the machinations of needy relatives with designs upon his wealth. His love was sincere so far as it went; but it was by no

means so deeply rooted that he could not tear it up if necessity arose; and as he closed and addressed the missive, he told himself that he was already a free man.

Nevertheless, the prompt reply he received from Beatrice was not altogether palatable to him. She said that since he had asked a straightforward question she would give an honest answer. She did love another man, and that man was no other than Ralph Thornleigh. She explained that her permission had been asked and given to exhibit the picture, though at the time she had no suspicion of the attention it would command. She sincerely regretted having thus been the innocent means of causing pain to so kind a friend, and was sure Mr Thornleigh would share the feeling. Finally—and this was the pill the Colonel found so nauseous—she thanked him for his offer to release her from her promise to marry him, and most gratefully accepted it.

'Most gratefully accepts it!' The Colonel did not care about the phrase at all. He could not blame her, however; so he crushed down his resentment, and wrote her a kindly letter of farewell.

Then he countermanded certain articles of jewellery he had ordered; directed his man to pack up immediately; placed two or three friends under vows of eternal secrecy, and confided to them that his engagement was at an end; and left for Switzerland, serenely confident that all London would hear of it within the week. He was not mistaken. During the first fortnight of his stay in the Engadine he received no fewer than ninety letters condoling with him on the shameful treatment accorded him at Miss Cairns-wood's hands. The Colonel answered all with his customary punctuality, and told himself that he might show in town next season with a perfectly 'clean slate.'

We may pass over the scene enacted at the hotel at Brighton when Miss Macallan learned of her niece's dismissal of Colonel Stardale; it was not edifying. We will turn rather to Mr Thornleigh, who received from Beatrice on the day the Colonel's farewell reached her, an urgent summons, which he obeyed in the promptest fashion. He called upon Mr Macallan, told him he was now in a position to offer Beatrice a comfortable home, and requested leave to 'speak to her.' Uncle Angus, who at the moment his visitor arrived was poring over a long letter from his niece, had very little to say. If Mr Thornleigh felt that his future was quite assured, and that he was prepared to take care of Beatrice, Mr Macallan had no objections to urge: quite the contrary; he would wish him God speed and bid him hasten to her at once. Ralph gave the required assurance, and went off to Brighton by the next train. Beatrice met him at the station; and has not lost sight of him since.

The long-delayed crash came soon after Colonel Stardale's departure, and the news, gleaned from the *Times*, drew from him a frank and generous offer of help, which, however, much to his sister's chagrin, Angus Macallan declined. Eventually, however, some friends combined to start him again in business, and he is getting on very well. He now lives at Hackney, which suits him, but which Miss Macallan calls 'an impossible place.' Ralph

and Beatrice are settled at Twickenham. He is fast making a reputation, and says Beatrice helps him; this may or may not be true, but they are very happy. So is Colonel Stardale, who is still a bachelor.

JEWISH DOCTORS.

THROUGHOUT the middle ages in both Europe and the East the science of the physician was in the hands of the Jews. We find at Bagdad and at Paris, at Vienna, and even in the Vatican, beside Prince and Pope, a Jew installed to be the court physician. Not only so, but the faculties of Medicine in the universities sprang out of Jewish schools. Many of the Jewish Doctors were held in the highest esteem, were the authors of works still extant, and contributed by no means a little to the emancipation of the science from superstitious methods.

At a very early age medicine was practised among the Jews, and the words of the author of the book *Ecclesiasticus*, 'Honour a physician with the honour due unto him for the uses which ye may have of him: for the Lord hath created him,' show in what esteem he was held. Moreover, the words that follow let us see that even in the days of the son of Sirach—the second century before Christ—the Jewish doctor had assumed a recognised position in the Oriental courts. The author goes on to say: 'He shall receive honour of the king. The skill of the physician shall lift up his head: and in the sight of great men he shall be in admiration.'

It is remarkable that the son of Sirach in the account of the physician confines his commendation to legitimate practice, as we should now term it, and gives no countenance to the astrological quackery which was so largely imported into the art of healing. He says: 'The Lord hath created medicines out of the earth; and he that is wise will not abhor them'—by these medicines herbs as well as minerals are to be understood. 'Of such doth the apothecary make a confection.'

That wrong-doing and sickness were intimately connected seems to have been a notion from an early age. When the blind man was healed by Christ, the question was asked whether he had sinned or his parents, that he had been born blind; and in the book of *Ecclesiasticus* the instruction given to the sick is, first to 'leave off sin, and order thine hands aright, and cleanse thy heart from all wickedness;' and after that, 'Give place to the physician, for the Lord hath created him: let him not go from thee, for thou hast need of him. There is a time when in their hands there is good success.'

In later times, a sect among the Jews made the practice of medicine one of its main objects; this was the sect of the Essenes and Therapeutæ, of whom Josephus and Philo give such curious accounts. Josephus relates how he saw a possessed man healed in the presence of Vespasian by one of this sect, named Eleazar. The practice seems to have been superstitious. He introduced a certain root into the nose of the afflicted man, and pronounced the name of Solomon, together with some magical formulæ.

Akiba was a physician of repute, after the fall of Jerusalem, as was also his friend Ishmael. The

two doctors were walking together in Jerusalem one day, when they were consulted by a sick man, and gave him a prescription. A gardener standing by at once questioned them. 'Who,' asked he, 'afflicted this man?'

'God,' was their reply.

The gardener at once posed them with, 'Then how dare you men interfere with the work of God?'

After a moment's pause, Akiba said: 'You are a gardener?'

'Yes—that is my trade.'

'Who produces fruits out of the earth?'

'God,' answered the gardener.

'Then,' said Akiba, 'how dare you meddle with His work?'

As the man was confounded, Akiba explained that as in a field grew weeds with the good seed, so were the elements of disease in the body of man along with the principle of health, and that as God gave the tiller of the soil the work of clearing the ground of weeds, and nourishing the good seeds, so did He send the physician to eradicate the evil from man's body, and encourage the growth in him of vigour and vital force.

The Talmud gives us an insight into the medical practices of the Jewish physicians, and we see that although there was much that was absurd and superstitious, there was nevertheless some sound principle, and real research into the origin of disease. What is very remarkable is that the physician Samuel, who died 243 A.D., devoted himself to dissection, and at his death left a sum of money to be spent in the purchase of corpses for anatomical research. Such studies could not be prosecuted without great danger, as the vulgar were certain to be alarmed, and were likely to fall upon a Jew who explored the construction of a dead body.

Abba Oumna was an illustrious physician of the fourth century, and a man of great nobility of character. He would not receive a fee in his hands, because he feared discouraging poor sick people from visiting him, as they might think he would not care to attend to them if unable to richly reward him. He had, accordingly, a box put in his anteroom with a slit in it, and every patient put in just what he liked, whether he were rich or poor. But perhaps the most striking story told of him is this. One day two students of medicine visited him from a distance and asked to be lodged with him overnight. He gave them up a room in which was a handsome carpet. Next morning they ran off with the carpet, went to the bazaar, and there offered it for sale. Oumna came by, and seeing the carpet, but not recognising the men, asked its price. They bade him offer a sum. He named what he would give for the carpet, but they replied it was too little. 'Not at all,' said he; 'that is what I paid for a carpet precisely similar to this one.' Then the two students told him it was his carpet which they had carried off, and asked him whether he had not formed an opinion that they were great rascals, when he found how his hospitality had been abused.

'Not at all,' answered the physician. 'A child of Israel never judges any from a first offence. Come—I will buy back my carpet, and do you give the money to the poor.'

When Oumna was consulted by very poor

persons, after he had recovered them from their disease, he was wont to give them money and say: 'Now go—get you bread and meat; those be the best doctors to attend on you henceforth.' The remedies scattered here and there in the Talmud have been collected in a curious work by Günzburger, published at Göttingen in 1743. As already intimated, many of them are of no real value. We will pass from the Talmudic period of medicine with one quotation which does not breathe the spirit of gallantry: 'There is a cure for all sicknesses if the stomach be clear; for all aches and pains if the heart be not affected; for all troubles if the head be not attacked; but there is no relief from a bad woman.'

An immense destruction of medical books as well as of others took place when the Saracens conquered Persia. Saad, son of Abu-Wakkas, wrote to Omar to know what was to be done with all the books that had come into his possession. 'Throw them into the river,' answered Omar. 'If they are good for anything, Allah can and will direct us without them; if good for naught, the sooner got rid of the better.'

Bassorah became a great school of medicine among the Jews, and Omar himself thought it advisable to call to his aid the famous Jewish physician Abu-Hafsa. The Calif Moawiyah I. encouraged the translation into Arabic of Hebrew tracts on the science of healing. The Bassorah school was moved to Bagdad, and from this school issued Isaac-ben-Amram, a native of Damascus. He was called in to attend the Emir of Cairouan, and found that a Christian physician was also in attendance, who opposed all that he prescribed. Then Isaac withdrew, saying: 'Disagreement among doctors is worse than tertian fever.'

Isaac-ben-Solomon, or Abu Jakub as he was called, was a disciple of the former Isaac, and was born about 832 A.D. He died at the age of a hundred, unmarried. Some one said to him in his old age: 'Are you not sorry that you leave behind you no children?' 'Not at all,' answered the physician. 'I leave what is better than children—my treatise on Fevers.' Another version of the story is that he valued his eighteen volumes—one a treatise on Philosophy, others on Religion—higher than a family of children.

At Salerno was a famous school of medicine, and many eminent Jewish physicians issued from it. The school was founded by the Greeks and Saracens, and at one time in it Pontus taught in Greek, Abdallah in Arabic, and Eliseus in Hebrew. It was through the Jews that the knowledge of medicine penetrated among the Arabs; and it was from the Saracens in Spain that the knowledge of medicine came to the Christians in Europe, where Montpellier became the rival medical school to Salerno. But unhappily the physicians of the ninth and tenth centuries had departed from the wise teaching of Samuel, who encouraged dissection. They came to regard the examination of the human body with the knife as a sort of sacrilege, and despised surgery as an ignoble profession. However, in the eleventh century medicine made great strides. 'The Oriental tongues,' says Cabanis, who has written on the *Revolutions of Medicine*, 'were familiar to the Jews, and from the time when Galenus and Hippocrates and the other masters of medicine were known only through Arabic and

Syriac translations, the Jews alone knew how to treat the sick with some sort of method, and to make a practical use of the labours of antiquity.' In fact, the profession of medicine became a specialty of the Jews. Every prince and every prelate had his Hebrew physician, who was thus at times drawn into controversy involuntarily. Anselm of Treves, who wrote in 1050, says that the Emperor Henry III. had a Jewish physician, and that this man and Wazo, Bishop of Liège, had often arguments with one another about certain passages in the Bible. One day the Jew bet his finger that he could defeat the bishop in argument. According to Anselm, he lost his bet, and then held out his finger to the bishop to have it amputated. Bishop Wazo laughingly bade him keep it in trust for him till he claimed it.

Ibn-Zohar was born at Penafior, in Spain, about 1070 A.D. and began to study medicine when he was ten years old. His father made him solemnly swear never to allow himself to be persuaded to employ poisons, for at that time Jewish physicians were in repute not solely for healing purposes, but also as being able to remove persons who were obnoxious. He was named house-physician to Ali, king of Seville; and had the bad fortune to recover the brother of the king, whom Ali had caused to be poisoned. In revenge for this, he was thrown into prison, and languished there till Jusuf, Prince of Morocco, drove Ali from his throne. Then he recovered his liberty, and entered into the service of his deliverer.

The most illustrious Jewish physician of the twelfth century was Moses-ben-Maimon, or Maimonides, as he is usually called. He was born in 1135, and became a magistrate of Cordova. He was forced in 1160 to embrace Islam, but fled at the first opportunity, and took refuge in Egypt, where he became physician to several of the Sultans. In one of his letters he complains how hard were his duties, for if one of the children, wives, or servants of the Sultan was ill, he was detained in the palace till this member of the household was recovered. He had to visit the palace every day, and as he lived at three-quarters of a league from Cairo, his time was by this means greatly taken up. On his way, crowds of Jews and Mohammedans lined the road, and he had to attend to and prescribe for all. His consultations continued till late at night, and till sometimes he had lost the power of speech and fell asleep standing. Among the numerous works left by Maimonides is one on Bronchitis.

In Bagdad there lived in the same century a famous Arabic physician who lectured to Arabs. No Jew and no Christian was permitted to attend his lectures. However, a young Jew, Ebat-Allah, was most desirous of instruction; he persuaded a servant to conceal him in the lecture-room, and thus he attended the course for a whole year. One day the Professor was asked a question on medicine by a pupil, which he could not answer off hand, whereupon Ebat-Allah shouted forth the reply from his hiding-place. He recollected having heard it in one of the former lectures. He was brought forth from his place of concealment, and the physician on questioning him was astounded to find that he had learned more than

all the rest of his pupils. He afterwards became famous, became physician to the Calif, and acquired the title of 'The Unique.' He deserted the faith of his fathers for Mohammedanism, and was bitterly reproached for becoming a renegade by a fellow-physician at court who was a Christian. He died in 1164, blind, deaf, and in abject poverty.

Abu Bekr Mohammed Ibn-Zohar was a Jewish doctor at the court of Jusuf, Prince of Morocco. One day, the Prince, hastily entering his physician's cabinet, did not find him there, but on the table were some Arabic verses from his hand, blotted with his tears, in which he bewailed his loneliness, separated from wife and children, who were at Seville. The Prince went away, and without a word to Ibn-Zohar, wrote to the Governor of Seville to send over to Morocco the family of the Jewish doctor. When they had arrived, Jusuf lodged them in a handsome house, and then sent his physician there, saying that he would find in that house certain persons who had long suffered from heartache, whom he desired him to cure.

In 1246 the Council of Béziers forbade Christians having recourse to Israelite physicians; and the Council of Alby in 1254 condemned the employment of medicines made after Jewish prescriptions.

The faculty of Paris was unquestionably jealous of the favour in which Jewish doctors were held, for in 1301 it issued a decree forbidding men and women of the religion of Moses from exercising the medical profession towards any person of the Catholic religion. In Spain, also, several decrees of Councils were launched against the Jewish doctors, and against Christians employing them. The same was done by Councils at Avignon in 1326 and 1337; but these canons seem to have been ignored. The sick insisted on calling to their aid the men who were esteemed best able to treat their several maladies, regardless of their nationality and the faith they professed. At Montpellier, several fanatical priests excommunicated their parishioners who turned a deaf ear to their injunctions to abstain from recourse to Hebrew doctors, who, they said, were unqualified to act, not having received degrees at the university. James, king of Majorca and Count of Roussillon, by letters-patent forbade the Israelites practising medicine without having been examined and been granted faculties; and these letters were confirmed by Philip VI. in 1331.

At the beginning of the fourteenth century a furious controversy raged among the Jewish physicians relative to the advantage of an amulet with a figure of a lion on it which was in use and had been prescribed by Isaac de Lattes. It was interrupted by the expulsion of the Jews from France in 1306, when all the Jewish doctors of the school of Montpellier went into exile. Many were received into favour by Charles II., king of Naples, but great numbers were dispersed and died of want. In 1368 the Council of Lavaur, in Languedoc, renewed the canons against the practice of medicine by the Jews; but King John took them under his protection, and, by a decree in 1362, empowered them to exercise surgery and medicine if they had passed a qualifying examination. Under this decree the Jews held their own to the end of the century.

We have not space to mention the names of the most famous even of the numerous Israelite medical men of the succeeding centuries, but we must not omit to notice the successful operation for cataract on Don John II. of Aragon by Abiabar, Jewish surgeon of Lerida, in 1468. In 1492, Ferdinand and Isabella banished all Jews from Spain. The popes Eugenius IV. and Nicolas V. his successor forbade Christians from calling to their aid Hebrew doctors, surgeons, and apothecaries. Their successors, however, did not share their intolerance. Paul II. tolerated Jewish physicians, and exempted them from wearing the red gabardine which marked those of their race and religion. Julius II. had a private physician who was a Hebrew; so had Leo X. the famous Bonnet de Lattes; so had Paul III. and Julius III. Some of the Italian Jew physicians, Balmez, Manteno, and Alatino translated Arabic treatises into Latin, and materially assisted in the diffusion of medical knowledge. In 1555 the imperious Paul IV. forbade the practice of medicine by Jews; and as this papal bull was disregarded generally, it was renewed by Pius IV., then by Gregory XIII., in 1562 and 1581. However, Sixtus V. reversed these decisions by a bull in 1586, in which he accorded full permission to Israelite doctors to minister to Christian patients.

THE MONTH: SCIENCE AND ARTS.

THE *Kew Bulletin* publishes the results of inquiries which have been made with reference to a plant yielding 'Meing,' a preparation which is much used for chewing by the Laos, a people inhabiting a district of Siam. The plant used in the preparation of this delicacy is the Assam tea-plant of commerce, which is not employed for making an infused beverage, as in other lands, but is made up into Meing. This is prepared by steaming the leaves, tying them up in bundles, and burying them in the ground for a period of about fifteen days, after which the compound will keep for two years or more. The chewing of Meing is almost universal among the Laos, and is especially esteemed by those who are engaged in severe bodily labour.

It is generally believed that in Britain and in other European countries tea is used only in the form of the 'cup that cheers;' but it would seem that this is not the case. It is reported on good authority that tea eaten dry is supposed, among certain classes, especially domestic servants, to be good for the complexion, and that when the taste is once acquired, the desire for the leaf assumes all the importance of a craze like opium-smoking or dram-drinking, and is as pernicious as either. It is supposed that the erroneous notion that tea can have any influence in beautifying the complexion arises from the circumstance that the Chinese used to treat the tea-leaves with arsenic, a drug which is known to have a peculiar clearing influence upon the skin of those who take it habitually.

Legislation for the protection of the eggs of

wild-birds has long been urgently called for, and the question is discussed anew by Mr E. P. Knubley in a recent number of the *Annals of Scottish Natural History*. It is there suggested that County Councils should acquire powers from Parliament from time to time and as necessity arises to protect mountains, commons, and waste places, lakes, portions of cliff and foreshore, for certain months of the year. In the meantime, landlords and occupiers having control over such places would do good by protecting as far as possible birds breeding on their lands.

In view of the danger of explosion if a naked light be used on board a tank oil-steamer, Custom-house officers are directed in future to use in 'rummaging' such vessels electric lights of special pattern. Another recent Customs' order directs that packages said to contain photographic preparations sensitive to white light shall be examined only by ruby-coloured lanterns. Both these regulations were much needed, and the latter will be particularly appreciated by tourist photographers, who have often had to deplore the loss of valuable plates, negatives in embryo, through the conscientious persistence of a Custom-house officer.

A curious light is thrown on the perfection to which natural wine is imitated by modern chemical methods in a story that is related by our consul at Cadiz. This gentleman relates that he and a friend, visiting one of the native sherry cellars there, partook of two samples of wine which seemed to them to be almost identical in flavour and quality. To their surprise, they were told that one of these wines was a natural product, the market price of which was fifty pounds a butt, while the other sample was a manufactured article, which costs fourpence-halfpenny per bottle, and is probably retailed at four shillings per bottle. This imitation of the natural juice of the grape can hardly come under the head of adulteration or sophistication, but must rather be looked upon as a triumph of modern chemistry. The natural product is first analysed, and the chemist, ascertaining the exact nature of its constituent parts, is able to combine those constituents, and thus reproduce as nearly as possible the original compound.

The *North-eastern Daily Gazette* announces the discovery of a new and simple process of producing caustic soda, chlorine, and other chemical products, direct from the brine, by electricity. The most careful tests show an economy of over fifty per cent. in favour of the new process, as compared with former methods. It is described as the simplest of all the known processes of soda-making, the caustic soda being produced direct from the brine in one operation instead of two. At present carbonate of soda is first produced, and from that the caustic soda is made. 'The valuable chlorine is also saved and utilised for the production of bleaching powder and other bye-products.' Eminent chemists and electricians have already pronounced the new method a complete success from a chemical point of view; and it is said that there is every prospect of its being worked as a commercial success.

Mr Van der Weyde, the well-known London photographer, has invented a method of causing or curing distortion in photographic pictures by an appliance which he names the Photo-corrector.

For instance, if in a photograph the head of the subject be rendered too large—as it must be if the face be thrown at all forward—its size can be reduced by this new agent; hands and feet of large proportions, whether their size be due to the fault of the photograph or to Nature herself, can be reduced in either width or length, or both, at the will of the operator. These changes are brought about, not by any stretching or shrinkage of the photographic film, but by purely optical means. As the method adopted forms the subject of a patent, its details are not yet made public.

The art of ballooning for military purposes continues to excite the attention of the authorities, and experiments are becoming common in all countries. In Russia, this subject forms an important part of military training, and a balloon floating at an altitude of two thousand feet, and carrying a powerful electric search-light, has been used there experimentally as a means of throwing a powerful beam of light upon the earth beneath. In Germany, such experiments have been encouraged by the Emperor William, who has promised an annual donation of twenty thousand marks to the Association founded in that country to promote the art of *aërostation*.

It is not generally known that no one has a right to use even the simple glass still commonly employed for chemical work unless he holds a license from the Board of Inland Revenue. The subject has recently assumed prominence from the fact of an analytical chemist being called upon to pay license duty for using such a still. It is satisfactory to note that on the receipt of a protest against payment of this duty it has been officially declared that the Board have no desire to extend the obligation to take out a license for stills used solely for distilling water, and that if any analytical chemist will submit his case to the Board, it will receive careful consideration.

The cheap production of the beautiful metal, aluminium, continues to lead to various new applications of the material, which, on account of its extreme lightness as well as its fine appearance, causes it to find favour in many employments. It is presently to be used in a totally new service in the city of Chicago, where a house of sixteen storeys, at the corner of State and Madison Streets, is to be erected, which will be entirely fronted on both sides with aluminium, in lieu of brick or terra-cotta. This new departure in house-building will be regarded with great interest. Opticians are also using aluminium largely for all kinds of fittings for instruments, such as mounts of lenses, tubes for telescopes, cases for opera glasses, and even tripod legs for cameras. It is also coming into use for such ornamental things as were formerly made of silver or ormolu; and many shops where such things are sold are now displaying a variety of articles made of the pretty white metal.

While aluminium was daily becoming cheaper, the price of platinum recently rose nearly to that of gold, a result brought about, it is said, by a combination between English merchants and brokers in St Petersburg, who controlled the output from the Uralian mines. The increase in price had, however, one good effect in causing new sources of supply to be discovered, and the price of the metal quickly went down to its old level. There are now in the Urals forty mines

along the course of a single river, the grains of ore being obtained from the sand by the very primitive process of washing in cradles. Were it not for the extraordinary weight of the metallic grains, much of the metal would under this treatment be washed away. The metal as found requires careful purification, for with it are commonly associated gold, iron, osmium, iridium, and other rare metals.

It will be remembered that last session a resolution of the House of Commons was passed, at the instance of Sir E. Birkbeck, relative to the establishment of a complete system of electrical communication on our coasts. Many of our coastguard stations, lifeboat houses, and post-offices are now in electrical communication, and in more than one instance the new departure has already led to the saving of lives. It is stated that the Royal Commission which has been dealing with telegraphic communication between lightships and the shore will recommend that the four lightships which guard the terrible Goodwin Sands shall forthwith be placed in electrical communication with the coast. Those who dwell in the neighbourhood of the Downs know how often lives might have been saved if communication with these lightships had been more prompt.

The Excise authorities in London have lately been doing their best to stop the sale of cigar stumps. In cases which they have brought before the courts it has been distinctly proved that stewards of clubs, and those having the charge of public resorts where large numbers of cigars are consumed, make a practice of selling the stubs, or ends, at the rate of about one shilling per pound to certain factories at the east end of London, where they are chopped up and rolled in fresh tobacco leaves, and ultimately sold once more as 'cigars.' The authorities have stopped this traffic on the ground of fraud against the revenue, but at the same time they are doing good work in making difficult the manufacture of so-called cigars which, saturated with nicotine, must be most pernicious to the consumer.

A German paper asserts that the camels which were introduced into German South-west Africa last year have proved most valuable as a means of keeping up communication between distant places as well as for long journeys into the interior of the country; the power of these remarkable animals of being able to travel for an entire week without food or water has been put to the test again and again. They are said to stand the climate well, and are not subject to many fatal diseases which attack both horses and cattle in this part of South Africa.

Mr F. E. Ives of Philadelphia, whose method of combining three photographic pictures taken under special conditions with three coloured glasses of selected tints, and combining their images on a screen by optical means so as to form a veritable picture in colours, was brought by him before our Royal Society some months back, has now produced commercially a modified form of the instrument, which he calls the *Heliochromoscope*. This is a table appliance in which is placed a special triple photograph, and which is said to reproduce the lights and shades and colours of Nature as readily as the phonograph

reproduces sounds. Mr Ives' instrument has certainly the advantage over Edison's phonograph in the fact that it has not only achieved success but is a marketable article. The phonograph, on the other hand, about which so many wonders have been recorded, seems, for some reason or other, to hang fire; so far as we can learn it is neither advertised nor sold.

Saccharin, that wonderful product of coal-tar, which is said to be three hundred times sweeter than sugar, and is now known as a valuable therapeutic agent, has recently found a new application as a substitute for sugar in the preservation of fruits. This industry has hitherto found an obstacle to its operations in the circumstance that certain fruits have associated with their skins micro-organisms which in the presence of cane-sugar set up fermentation. This action can be stayed by the employment of excess of sugar, or by heating the fruit to a high temperature in order to kill the germs which cause the mischief; but both expedients are prejudicial to the flavour of the fruit. By the employment of saccharin in the proportion of one and a quarter ounces to four gallons of water the difficulty vanishes, and the bottled fruit need not be exposed to a temperature higher than one hundred and eighty degrees Fahrenheit.

The San Francisco and San Mateo Electric Railway has a novel device for overcoming the difficulties connected with a steep incline. The road has a double track, the up-track as it reaches the difficult place—a grade of fourteen in one hundred—making a detour, so as to climb the hill by a longer route having an easier ascent. The down-track comes direct down the hill; but to avoid a too swift descent, a counter-weight is drawn up as the train descends. The track has beneath it a conduit, in which runs a carriage carrying this weight; and by means of a half-inch wire-rope the weighted carriage is attached to the car before it begins its descent. The rope passes several times round a drum on the car, so that the rate of speed can be controlled by the man in charge of the train.

At a recent meeting of the Iron and Steel Institute, a paper by Mr Hadfield on 'Alloys of Iron and Chromium' met with much attention. In America, chrome-steel has been produced for some years; but there are difficulties in making the alloys, especially when large masses have to be dealt with, which have not been yet overcome. That chrome steel is a valuable metal for many purposes was vouched for by Mr Webb of Crewe, who asserted that springs made from it were so superior to those made of any other material that the springs on the North-western Railway had been replaced by those made of the new material. He stated also that a better-wearing tire was producible from chrome steel than from ordinary metal, and that it was valuable in the making of various tools.

Some time ago, Mr John Aitken pointed out that dust particles in the air would, under certain conditions, attract moisture, and thus form cloud or fog. Based upon this observation, he has now invented an instrument for ascertaining the degree of impurity which may exist in the air of a room or other enclosed space. The air to be tested is held in a tube while a jet of steam is passed through it, when coloured fog is pro-

duced varying in tint from delicate green to deep blue. The colour indicates in a very accurate manner the degree to which the air is impregnated with dust particles.

A correspondent of the *Spectator* has been making some curious experiments at the London Zoological Gardens with reference to the effect of musical instruments upon the animals confined there. At the sound of the violin, the six-months'-old chimpanzee 'Jack,' which may be regarded as the most highly organised animal in the Gardens, evinced at first every symptom of fear, its hair standing erect, and the creature hiding itself in its blanket. But fear soon gave way to a more pleasurable feeling, and the little creature listened intently, and with evident satisfaction, to the music. His joy seemed to know no bounds when the violin reproduced the sounds of the bagpipes, for he turned head over heels, and threw his straw about in handfuls in the excess of his delight.

From the Berlin Royal Observatory comes a request, or perhaps we should say invitation, to observers all over the world to make records concerning a very remarkable meteorological phenomenon which since the year 1885 has been more or less prevalent. This phenomenon takes the form of luminous clouds which appear bright on the twilight sky, and differ in this respect from ordinary cirrus clouds, which appear dark under the same conditions. These luminous clouds have been repeatedly and simultaneously photographed from various points in the neighbourhood of Berlin, and their altitude has thus been ascertained to be exceedingly great—over five miles.

In a recent speech at Colchester, the new President of the Board of Agriculture encouraged farmers to take a less cheerless view of things, and ventured to assert that when accurate and official opinions could be formed, agricultural matters might not be so bad as they seemed. He pointed out that there were branches of industry which did not receive due attention at the hands of our farmers, and as a proof stated that in 1890 we paid to foreigners £10,398,843 for butter; £3,428,806 for eggs; £4,975,134 for cheese; £497,857 for poultry and game; and £4,804,750 for vegetables and fruit—in all nearly twenty-five millions of money for produce, a good deal of which could be raised at home.

CURIOUS AND AMUSING CORRESPONDENCE.

PEOPLE are generally very particular when writing to royalty, and take special care to make their correspondence as acceptable as possible. Dr Schmidt, however, of the Cathedral of Berlin once wrote a letter to the king of Prussia of a very formal character, and one which showed that he thought more of business than of flattery. The letter was couched in these terms:

SIRE—I acquaint Your Majesty, first, that there are wanting Books of Psalms for the royal family. I acquaint Your Majesty, second, that there wants wood to warm the royal seats. I acquaint Your Majesty, third, that the balus-

trade next the river, behind the church, is become ruinous.

SCHMIDT,
Sacrist of the Cathedral.

The king was very much amused by this epistle, and, adopting Dr Schmidt's style, replied as follows :

I acquaint you, M. Sacrist Schmidt, first, that those who want to sing may buy books. Second, I acquaint M. Sacrist Schmidt that those who want to be warm must buy wood. Third, I acquaint M. Sacrist Schmidt that I shall not trust any longer to the balustrade next the river. And I acquaint M. Sacrist Schmidt, fourth, that I will not have any more correspondence with him.

FREDERICK.

Like the newspapers, the king thought it advisable to inform his correspondent, in his own way, that 'the correspondence must now cease.'

The placing of letters in wrong envelopes has been responsible for much curious correspondence, and brought about many awkward situations. A French Bishop once made a ludicrous mistake in this way, and his experience would probably induce him to exercise more care on future occasions. He was writing to his Cardinal and a certain Duchess at the same time, and when the letters were delivered, the Cardinal read : 'I have just now wrote to his old Eminence, my charming queen, to entreat his leave to return to Paris. I make no doubt but he will grant it. As for the rest, the air is so pure here that I have acquired a good state of health, as you will perceive when I come to have the happiness of seeing you.'

Of course the Bishop was in blissful ignorance of what he had done ; so we can easily understand his feelings at the answer evoked by his love-letter. This is what was sent him : 'His old Eminence advises you to extinguish your passion. His Majesty orders you to remain in your diocese till further orders ; and requires that your life and conversation may be as pure as the air you breathe ; and that you make no other use of your good state of health but to discharge the duties of your function.'

In view of these orders, his 'charming queen' would stand a very poor chance of seeing how the pure air had improved the health of her ardent admirer.

Ignorance of the rules of orthography is also a common cause of curious letters. Here is a case in point, the epistle being one received by a gentleman from his gardener : 'HONRED SIR—My wif an I have taken the Ian from Windsor. Jenny Cedar has lost her head, the rest of the scrubs are all well. The Oxen are come down to prase the Goods.' One would hardly imagine, from reading the above, that the intelligence he sought to convey was as follows : 'HONOURED SIR—My wife and I have taken the influenza. The Virginia cedar has lost its head ; the rest of the shrubs are all well. The auctioneer came down to appraise the goods.'

The doctor, too, who received the annexed note from one of his patients must have been somewhat puzzled as to the nature of the complaint, and if he consulted his pharmacopœia he would not find it mentioned there, at anyrate not as

described by the sufferer : 'SUR—I weesh yew wood koom an see me—I av got a bad kould-eel in my Bowhills—an av lost my Happy tide.—Sur Yer umbel Sarvent.'

Some curious letters passed between Garrick and a man named Stone. The latter was employed to get recruits for the low parts of the drama, and one night he wrote to Garrick : 'SIR—The Bishop of Winchester is getting drunk at the *Bear*, and swears he will not play to-night.' At first sight, this seems peculiar conduct for a Bishop ; but it should be explained that the communication only refers to the man engaged to take that character in the play of *Henry VIII.*

On another occasion, Garrick wrote to Stone : 'If you can get me two good *murderers*, I will pay you handsomely, particularly the spouting fellow who keeps the apple stall on Tower Hill ; the cut in his face is just the thing. Pick me up an *alderman* or two for *Richard*, if you can ; and I have no objection to treat with you for a comely *mayor*.'

Things do not seem to have gone on smoothly, however, for in one letter Stone complains : 'Mr Lacy turned me out of the lobby yesterday. I only *ax'd* for my two guineas for the last Bishop, and he said I should not have a farthing. I cannot live upon air. I have a few *Cupids* you may have cheap, as they belong to a poor journeyman shoemaker I drink with now and then.' This seems to have pleased Garrick, for he replied : 'Stone, you are the best fellow in the world ; bring the *Cupids* to the theatre to-morrow : if they are under six, and well made, you shall have a guinea apiece for them.'

Some people say that self-praise is no recommendation. Liston, the comic actor, does not appear to have entertained this opinion, judging from a letter which he sent to the newspapers in June 1817. It is an admirable 'puff,' and no doubt would prove a splendid advertisement. It was couched in the following terms :

Mr Liston to the Editor.—SIR—My benefit takes place this evening, at Covent Garden Theatre, and I doubt not will be splendidly attended. Several parties in the first circle of fashion were made the moment it was announced. I shall perform Fogrum in *The Slave* and Leperello in *The Libertine* ; and in the delineations of those *arduous* characters I shall display much feeling and discrimination, together with great taste in my dresses and elegance in my manner. The audience will be delighted with my exertions, and testify by rapturous applause their most decided approbation. When we consider, in addition to my professional merits, the loveliness of my person and fascinations of my face, which are only equalled by the amiability of my private character, having never pinched my children nor kicked my wife out of bed, there is no doubt but this *Puff* will not be inserted in vain.

J. LISTON.

While dealing with theatrical items, it may not be out of place to give a copy of a letter which Goldsmith sent to George Colman the Elder with reference to the subsequently successful comedy of *She Stoops to Conquer* :

DEAR SIR—I entreat you'll relieve me from

that state of suspense in which I have been kept for a long time. Whatever objections you have made, or shall make, to my play I will endeavour to remove, and not argue about them. To bring in any new judges either of its merits or faults I can never submit to. Upon a former occasion, when my other play was before Mr Garrick, he offered to bring me before Mr Whitehead's tribunal, but I refused the proposal with indignation. I hope I shall not experience as hard treatment from you as from him. I have, as you know, a large sum of money to make up shortly; by accepting my play, I can readily satisfy my creditor that way; at anyrate, I must look about to some certainty to be prepared. For God sake, take the play, and let us make the best of it; and let me have the same measure at least which you have given as bad plays as mine.

OLIVER GOLDSMITH.

'Love's young dream' is responsible for a number of amusing letters, but these are generally very loving and very long. After the knot has been tied, shorter ones may do; but it will be difficult to find a letter more concise and to the point than that sent by Dr Donne to his wife's parents. He had married a lady belonging to a rich family without the consent of her parents, and in consequence was treated with great asperity, in fact he was told by his father-in-law that he was not to expect any money from him. The Doctor went home and penned the pithy note: 'John Donne, Anne Donne, *undone*,' which he sent to the gentleman in question, and this had the effect of restoring them to favour.

An advertiser for a wife received the following reply, but it is scarcely probable that it would lead to business. Would-be advertisers should take warning. 'SIR—Seeing Advertisement In the *Independent* that you are in want of a partner for life so I offer myself as a Candidate. But Before there is much more correspondence, I should like an intewrew with you. Notes the adres.'

Some correspondents are very brief, and do not waste words when they can possibly avoid it. The schoolmaster who received the note consisting of the home-made word 'Cepatomtogoataturing' as an excuse for the non-attendance of one of his scholars, would think that his correspondent had a desire to economise as much as possible. It was meant to convey the intelligence that the boy was 'kept at home to go a-taturing.' It is said that a gentleman who suddenly decided to go to America informed his wife to that effect in the following manner: 'DEAR WIFE—I am going to America.—Yours truly.' The lady's reply was equally laconic: 'DEAR HUSBAND—A pleasant voyage.—Yours, &c.' These letters are certainly brief enough, and there does not seem to be much love lost between the parties.

Official letters are also sometimes rather quaint. For instance, the letter sent by Lord North to Charles James Fox informing him that he had been turned out of the Government is rather curious: 'His Gracious Majesty [George III.] has been pleased to issue a new Commission, in which your name does not appear.'

The majority of people would prefer the style of writing adopted on one occasion by Lord Dorset, when several gentlemen submitted their

writings to Dryden for his decision as to whose was the best. Dryden, in giving the award to Lord Dorset, stated that he was charmed with the style and subject, and that that kind of writing exceeded any other, whether ancient or modern. We venture to think that most people would agree with him, for this is what he read: 'I promise to pay John Dryden, Esq., or order, on demand, the sum of five hundred pounds.—DORSET.'

TENNYSON.

YE winds that sweep round Britain's shore,
Ye waves that through her channels roar,
Together chant a solemn dirge
For the great Seer who breathes no more.

The preacher of a noble creed,
The sower of a noble seed,
He sought his Country's heart to purge,
And wrote that he who runs might read.

A man of God-inspired mind,
He saw where other eyes were blind,
And taught the world with wise command
In all God's works His Love to find:

He sang of Faith and Chivalry,
Of Truth and old-world Courtesy,
And touched with tender, loving hand
The failings of Humanity:

He ever sought to stem the tide
Of sin and sorrow, stern to chide
The oppressor's misbegotten scorn,
And prune the barren tree of Pride:

He knew the Spirit of his Age,
And guided it with counsel sage
To choose the golden ears of corn,
But spurn the chaff with righteous rage.

Then chant, ye winds, a song of praise,
And you, ye waves, a Pean raise,
Though he, who oft your shores has trod,
Sleeps in the Autumn of his days.

For our great Prophet is not dead,
But, risen to higher realms instead,
Learns the deep mysteries of God,
Where beams of perfect Light are shed.

GERALD CAMPBELL.

DESTRUCTION OF THE IRON GATES OF THE DANUBE.

ON the 15th of September 1890 a work was inaugurated calculated to be of the greatest importance to Austro-Hungary—the opening up of the Iron Gates of the Danube. In presence of the Hungarian Minister, the Austrian Minister of Commerce, and the official representatives of Servia, a portion of the rock Greben, which towers out midway into the river, was blasted, and thus the long-wished-for work of clearing formally begun; and the Iron Gate, freed from its hitherto dangerous obstructions, is to be made navigable to ships of every size at all seasons of the year.

The district of the Lower Danube is but little known to the modern tourist; yet the Iron Gate is not only the most important, but the most magnificent portion of the grand and picturesque Danube, as also the most stupendous gorge in all Europe, unequalled in that quarter of the globe. Under the appellation of Iron Gate is broadly comprised the fifty-five miles' stretch from Alibeg, somewhat below the Hungarian Baziás, to the Servian town Sip, below Orsóva, where the powerful stream, penned in between lofty mountain banks, rushes through and over the enormous masses of rock lying in its bed, dashing headlong over reefs, breaking against sunken rocks, and forcing its way down stream in a wild series of rapids and whirlpools, which finally separate into (1) The Lesser Iron Gate with its six fathomless pools; (2) The deep water near Jutz; (3) The mountain gorge Kazan; and (4) The Great Iron Gate.

In its course, the river often changes its direction, flowing first eastwards, then south-east, north-east, and after a short distance, due east again, and back to south-east. The V-shaped centre pointing south is known as the Klissura. At this part of the Iron Gate a series of striking pictures glide before our eyes. Decked with a wealth of flora, the lofty passes, with their caver-

nous precipices, tower upwards, enclosing the river flowing at their feet, now glistening smooth as a silver mirror, now with its surface ruffled by curling ripples, again tossed, as if in anger, into huge waves, casting showers of spray around them. In truth, it is a very picture of loveliness.

It is generally thought that the Iron Gate proper is the breach between the Upper and Lower Danube; this is erroneous; the gorge rather lies above the Iron Gate between Alibeg and Orsova. At the last-named place the Danube has accomplished its course over the high-lying ground stretching north to south, which forms the junction of the Transylvanian Alps and Banater Mountains, and the point of union between the Carpathians and Balkans.

The first obstacle to navigation is presented by the reef Sztenka, near Golubacz, below Moldavia, eight hundred and thirty-one yards in length, which, when the river is low, renders it impassable for large vessels. The stream is here ten hundred and thirty-nine yards broad, with a moderate fall. At Drenkowa, some distance lower down, are the quartz-mica-schist banks, Kozla and Dojke. The river-bed, sometimes narrowing to three hundred and seventy yards, is quite filled with this schist. Here, too, we have the Gospodjin Vir (Maiden's Whirlpool), where, affixed to the rocks, we still find votive tablets recording that in the year 34 A.D. the fourth and fifth Legions excavated the Roman road on the right bank, of which there are many traces still visible. Where the rock was so precipitous that it was impossible to continue the road, the Romans constructed a kind of gallery, resting on beams let into the rock.

Opposite, on the left bank, there now runs the whole length of the gorge the new road made by Count Stephen Széchenyi in 1834-39, and named after him. Some few miles past the bank Dojke, we come upon two rocks, Izlás and Tachtalia. Navigation is here extremely difficult, at places only possible by means of a canal about four yards wide. A short distance farther on the right bank we come to the projecting rock

Greben, which narrows the river to two hundred and thirty yards, and marking the site of the blasting operations of September 1890.

Here ends the so-called Lesser Iron Gate. The Danube, hitherto flowing from south-east to south, now enters the lake-like basin of Milanovacz, through which it pursues an even course. Upon the first rocky defile of the Lesser Iron Gate, below the basin of Milanovacz, follows the second defile, extending a length of four miles to Old Orsova, and generically known as Kazan. Running north-east, it forms the east side of the Klissura. Here the dangerous rapid of Jutz forms the first obstacle to shipping; upon that follows the entrance to the Kazan Pass, a romantically picturesque gorge, which at its narrowest is but one hundred and sixty-four yards wide, and some forty-five to eighty-two yards deep. In flood, the current is so strong that steamers are only able to surmount it by working at full pressure. Here, again, we find on the right bank a tablet of Trajan, partly destroyed, and blackened by the fire of Servian fishermen, bearing witness to Roman skill in road-making. Its inscription tells that it was begun by Tiberius and finished by Trajan.

Below the Kazan Pass we come to the smaller basin of Old Orsova, formed by the slight recession of the mountains on the right bank. We pass the Cserna estuary, and the island fortress of New Orsova, or Ada Kaleh, surrendered to Austro-Hungary by the Porte in 1878.

Just where the Danube passes out of Austrian dominions, it enters upon the last but greatest and most dangerous rock defile, the Great Iron Gate. The current representation of this is incorrect. Here we have no narrow rocky gorge to do with. On the contrary, the shores, though precipitous, lie far asunder, and the river has assumed an imposing width; its whole bed studded with enormous masses of rock, rising more or less above the surface of the waters, according to the state of the river. In autumn these predominate to such a degree that it is matter of wonder what has become of the immense body of water one has seen rushing through the Klissura gorge. It seems almost probable that a portion of the water burrows underground to reappear in the defile. The masses of rock divide into two distinct cataracts. In the first division they form a comparatively long even ridge, so little under water that, when the river is low, navigation is utterly impossible. The other division, in the left half of the river, exhibits numerous small reefs above the level of the water, which rise higher towards the middle of the stream, until they present one broad connected mass of rock running obliquely across it, almost reaching to the opposite shore. The river is thus converted into a series of whirlpools and cross-currents, which, on account of its great fall, are so violent that sailing and rowing boats are barely able to force a passage; it is even dangerous for steamers. The whole gorge comes to an end with the Great Iron Gate. Below it, the Danube enters its wide lower basin, through which it flows without further hindrance.

The cataracts of the Danube having been held as impassable by the ancients, it is easy to understand how the Danubius—the upper and middle portions of the river—and the Ister, its lower

portion, came to be regarded by them as two distinct rivers. The Romans first discovered them to be one and the same in the year 287 B.C. It is known how they succeeded in making the Danube gorge passable by means of their skilfully-constructed road; while the remains of great stone dams on the Servian shore prove that they also attempted the actual navigation of the cataracts. That work, however, remained incomplete. Since the Roman era to the later part of the last century there had been no attempt to facilitate the passage of the Iron Gate. In 1778, Captain Lauterer, an Austrian, first raised the question; but it was some fifty years later that Count Stephen Széchenyi, 'the great Hungarian,' took the matter practically in hand; and from his letters and diaries we find that he prosecuted the work unremittingly. Széchenyi found a beneficent patron in Palatine Joseph; gained Milos Obrenvics, Prince of Servia, over to the cause, and endeavoured to rouse the interest of the Porte in it by making known his plan to Omar Pasha, Commandant of Orsova. The technical working of it he entrusted to Paul Vášarhelyi, already known as an eminent hydraulic engineer. Vášarhelyi made a thorough investigation of the nature and extent of the falls on the Lower Danube, and established precise data, upon which he drew up a plan for the regulation of the cataracts, so carefully elaborated and thought out, that it has formed the basis of all subsequent undertakings and projects, and is even the groundwork of that now in progress. Under Vášarhelyi's direction, in the winter of 1834-35, a ship canal one hundred and twenty-four yards long by thirty-two and four-fifths broad was blasted in the rock-reef Dojke, thus inseparably connecting his name, as well as that of Széchenyi, with forcing a passage through the Iron Gate.

In 1847 to 1849 some lesser blasting operations, on the same lines, were effected by the Danube Steam-ship Company; but political events at that time hindered the further execution of Széchenyi's project. No sooner did the political horizon clear, than the question came again to the fore; the Government as well as technical men taking up a matter fraught with considerations of national interest. When, on the breaking out of the Crimean War, Austrian troops marched into Wallachia, public interest once more turned upon the Iron Gate. In 1854, the Austrian Government despatched two engineers, Mensburger and Wex, to the Lower Danube, to study the cataracts and work out various plans. Some minor blasting-work begun by the Government in 1854 was continued until 1866. Energetic measures could not, however, be adopted on account of the steady opposition maintained by the Porte. At the close of the Crimean War, the Paris Congress, in an Act bearing date March 30, 1856, Article 15, declared the navigation of the Danube free. The London Congress, assembled to settle the Pontus question, also took into consideration the navigation of the Danube. The London Convention of March 13, 1871, ensured to those States on its banks the right to levy toll on ships' freights, to cover the cost of making the cataracts navigable. In that same year the Danube Steam-ship Company commissioned the American engineer, MacAlpin,

to report upon the cataracts and draw up schemes; which, however, came to nothing. It was not until 1874 that an understanding was arrived at between Austro-Hungary and Turkey, by which both States agreed to send a mixed Commission to the Lower Danube to work out a scheme for the whole extent. This plan it is which is now for the most part being carried out.

Even then, some years were suffered to elapse without any active steps having been taken: until, fresh international complications arising, attention was once more attracted to the obstructions to navigation in the Danube, that important highway of commerce. The Congress of Berlin, which followed upon the Russo-Turkish War, also took up the advisability of making the Danube navigable. Servia having bound herself in the form of a Convention, July 8, 1878, to offer all possible facilities to the furtherance of the work, the Berlin Congress, in Article 57 of July 13, 1878, states: 'The carrying out of the work intended to remove the obstacles to navigation caused by the Iron Gate and the cataracts is entrusted to Austro-Hungary. The States on the banks of this portion of the river offer every facility in the interests of the work. The decision arrived at in Article 6 of the London Convention of March 13, 1871, anent the right to levy a temporary toll for the purpose of covering the expenses of the said work, remains in force.' An agreement was subsequently arrived at between the two Governments, by which the Austro-Hungarian monarchy yielded up her rights and handed over her obligations to Hungary. The Hungarian Government, which had called in a number of foreign experts to examine into and report upon the improvement of their home waterways, entrusted them in 1879 also to study and make Reports upon the cataracts of the Danube. This done, no further move was made until at length, in 1883, the Minister of Traffic, Kemény, charged Ernst Wallandt, the then Commissioner of Works, to make a series of investigations and experiments on the spot, taking as his basis the Reports of the foreign experts and of the International Commission of 1874. Thus ensued the plan now in course of execution, the fruit of long and searching study.

However, the financial position of Hungary being at that time anything but good, a fresh hindrance arose. This was eventually overcome by the strenuous exertions of Gabriel von Baross, made Minister of Commerce in 1887, who did not rest until he had got things into working order. The Hungarian Government and Legislative Assemblies granted the necessary funds, in accordance with Code 27, which states that the carrying out of the work is to be defrayed by the Hungarian State Treasury; and of Code 12, 1889, authorising that these costs be drawn from the State Exchequer. Thereupon, Herr Baross at once organised a Committee of Management, at the head of which was placed the Councillor of Department, Herr Wallandt. Official authority was conceded on June 16, 1890; and the work was begun in September 1890, to be completed, according to contract, by 1895. The need is great. Traffic is rapidly increasing on the Lower Danube. The Danube Steamship Company has started some shallow boats for passenger and

express goods-traffic, and iron lighters for freight; and when the water is low, passengers are sent on by road. But the cargo service is interrupted for months at a time, often from July to the following March; thus at the very time that the harvest in the Banater, Roumanian, and Bulgarian lowlands might be turned to account.

It has been resolved, according to the project of the International Commission of 1874, to do away with the whole of the obstructions to water-traffic by the construction of an open canal along the right bank of the Danube, which shall have a ground width of some eighty-eight yards, and be some two thousand five hundred yards long. For this purpose it will be necessary to remove 8734 cubic feet of rock; and to erect the intermediate dams which are to separate this canal from the river, a deposition of 20,411 cubic feet of material is necessary. The whole volume of rockwork, roughly estimated, amounts to four million cubic feet.

The contractor binds himself to accomplish at least ten per cent. of the work in 1890; from 1890 to 1894, twenty per cent. per annum; and to complete all the outstanding work in 1895. The entire cost is estimated at nine million guildens (about seven hundred thousand pounds), to be covered during that period by the shipping dues to be levied by Hungary. Commercially, the free navigation of the Danube is of the utmost importance to Austro-Hungary, which thus obtains a market for its natural industrial products in the south-east.

One further benefit from this great work must not be overlooked. Once control the rapids through the whole length of the gorge, the floods will find a speedier egress, and dangers of inundation, not alone on the Lower Theiss, but also for Budapest, will be lessened. The surplus waters of the Theiss, now unable to flow quickly enough through the gorge, causes the Danube to rise so high that it overflows its banks at Budapest.

Who, moreover, can fail to see the political significance of the work? The influence of Austro-Hungary in the Balkan Peninsula is only to be maintained by the Danube. It can only fulfil its mission of peace and protection in that quarter by utilising it to the utmost on behalf of economical, industrial, and agricultural interests.

At the opening ceremony, the official representative of Servia referred in his speech to the hopes connected with the undertaking—how that Servia awaits from it an increase of commerce on the Danube and the development of Belgrade into an important commercial centre. By the destruction of the Iron Gate, sailing-vessels of large draught will be enabled to reach Belgrade; as now many ocean steamers call at the Servian port of Badujevat, below the Iron Gate, to ship Negotin wine, and convey it thence by sea to France. And thus the neighbourly relations between Servia and Austro-Hungary will go on increasing.

Brave Bulgaria is also brought considerably nearer to that empire by the opening up of the Iron Gate, and will, presumably, be desirous to bind the friendly monarchy yet closer to it. Roumania, too, still at variance with Austro-Hungary on the subject of customs, will, it is to be hoped, even if reluctantly, become disposed to

pursue a more amicable policy towards it. Thus we have every reason to greet the work now going on as a work of peace, and to wish it an uninterrupted and speedy completion.

BLOOD ROYAL.*

By GRANT ALLEN,

Author of *In All Shades, This Mortal Coil, &c.*

CHAPTER XVI.—LOOKING ABOUT HIM.

DURING the rest of that broken term, Dick did little work at history: he had lost heart for Oxford, and was occupied mainly in looking out for employment, scholastic or otherwise. Employment, however, wasn't so easy to get. It never is nowadays. And Dick's case was peculiar. A certain vague suspicion always attaches to a man who has left the university, or proposes to leave it, without taking his degree. Dick found this disqualification told heavily against him. Everybody at Durham, to be sure, quite understood that Plantagenet was only going down from stress of private circumstances, the father having left his family wholly unprovided for; but elsewhere people looked askance at an applicant for work who could but give his possession of a college Scholarship as his sole credential. The dons, of course, were more anxious that Plantagenet should stop up to do credit to the college—he was a safe First in History, and hot favourite for the Lothian—than that he should go away and get paying work elsewhere; and in the end poor Dick began almost to despair of finding any other employment to bring in prompt cash than the hateful one at Chiddingwick which Maud had so determinedly set her face against.

Nor was it Maud only with whom he had now to contend in that matter of the Assembly Rooms. Mary, too, was against him. As soon as Maud returned to Chiddingwick, she had made it a duty to go straight to Mary and tell her how she felt about Dick's horrid proposal. Now, Mary at the first blush of it had been so full of admiration for Dick's heroic resolve—'for it was heroic, you know, Maud,' she said simply, calling her future sister-in-law for the first time by her Christian name—that she forgot at the moment the bare possibility of trying to advise Dick otherwise. But now that Maud suggested the opposite point of view to her, she saw quite clearly that Maud was right; while she herself, less accustomed to facing the facts of life, had been carried away at first sight by a specious piece of unnecessary self-sacrifice. She admired Dick all the same for it, but she recognised none the less that the heroic course was not necessarily the wisest one.

So she wrote to Dick, urging him strongly, not only for his own sake, but for hers and his family's, to keep away from Chiddingwick save in the last extremity. She was quite ready, she declared, if he did come, to stand by every word she had said on the point when he first came to see her; but still, Maud had convinced her that it was neither to his own interest nor his mother's and sisters' that he should turn

back again now upon the upward step he had taken in going up to Oxford. She showed the letter to Maud before sending it off; and as soon as Maud had read it, the two girls, united in their love and devotion for Dick, fell on one another's necks, and kissed, and cried, and sobbed with all their hearts till they were perfectly happy.

All this, however, though very wise in its way, didn't make poor Dick's path any the smoother to travel. He was at his wits' end what to do: no door seemed to open for him. But fortunately Maud had commended her cause to Archie Gillespie at parting. Now, Gillespie was a practical man, with more knowledge of the world than Dick or his sweetheart; being, indeed, the son of a well-to-do Glasgow lawyer, whose business he was to join on leaving Oxford. He had discovered, therefore, the importance in this world of the eternal backstairs, as contrasted with the difficulty of effecting an entrance anywhere by the big front door or other recognised channels. So, when Sir Bernard Gillingham, that mighty man at the Foreign Office, came up on his promised visit to his son at Durham, Gillespie took good care to make the best of the occasion by getting an introduction to him from the Born Poet; and being a person of pleasant manners and graceful address, he soon succeeded in producing a most favourable impression on the mind of the diplomatist. Diplomats are always immensely struck by a man who can speak the truth and yet be courteous. The last they exact as a *sine qua non* in life; but the first is a novelty to them. After a while, Gillespie mentioned to his new friend the painful case of an undergraduate of this college, Plantagenet by name, whose father had lately died under peculiar circumstances, leaving a large family totally unprovided for, and who was consequently obliged to go down without a degree and take what paying work he could find elsewhere immediately.

'Plantagenet! Let me see. That's the fellow that beat Trev. for the History Scholarship, isn't it?' Sir Bernard said, musing. 'Can't be one of the Sheffield Plantagenets? No, no, for they left a round sum of money, which has never been claimed, and is still in Chancery. Extinct, I believe; extinct. Yet the name's uncommon.'

'This Plantagenet of ours claims to be something much more exalted than that,' the Born Poet answered, trying to seem unconcerned; for ever since that little affair of the recitation from Barry Neville's Collected Works, his conscience or its substitute had sorely smitten him. 'I believe he wouldn't take the other Plantagenets' money if it came to him by right; he's so firmly convinced he's a son and heir of the genuine blood royal. He never says so, of course; he's much too 'cute for such folly; but he lets it be seen through a veil of profound reserve he's the real Simon Pure of Plantagenets, for all that; and I fancy he considers the Queen herself a mere new-fangled Stuart, whom he probably regards as Queen of Scots only.'

'Plantagenet!' Sir Bernard went on, still in the same musing voice, hardly heeding his son. 'And a specialist in history! One would say the man was cut out for the Pipe-roll or the Record Office.'

* Copyright 1892 in the United States of America by the Cassell Publishing Company.

'He knows more about the history of the Plantagenet period than any man I ever met,' Gillespie put in, striking while the iron was hot. 'If you should happen to hear of any chance at the Record Office, now, or any department like that, a recommendation from you'—

Sir Bernard snapped his fingers. 'Too late by fifty years!' he cried, with a pout of discontent—'too late by fifty years, at the very least, Mr Gillespie! The competitive examination system has been the ruin of the country! Why, look at the sort of young men that scrape in somehow nowadays, even into the diplomatic service—some of them, I assure you, with acquired *Hs*, which to my mind are almost worse than no *Hs* at all, they're so painfully obtrusive. I mean Trev. for the diplomatic service; and in the good old days, before this nonsense cropped up, I should have said to the fellow at the head of the F. O. for the time being: "Look here, I say, Smith or Jones, can't you find my eldest boy a good thing off the reel in our line somewhere?" And, by Jove, sir, before the week was out, as safe as houses, I'd have seen that boy gazetted outright to a paid attachéship at Rio or Copenhagen. But what's the case nowadays? Why, ever since this wretched examination fad has come up to spoil all, my boy'll have to go in and try his luck, helter-skelter, against all the tinkers and tailors, and soldiers and sailors, and butchers and bakers, and candlestick-makers, in the United Kingdom. That's what examinations have done for us! It's simply atrocious.'

Gillespie, with native tact, poured oil on the troubled waters. 'There are departments of the public service,' he said with politic vagueness, 'where birth and position no doubt enable a man to serve the State better than most of us others can serve it; and diplomacy is one of them. But even judged by that standard, the name of Plantagenet is surely one which has done solid work in its time for the country; for the monarch, as Joseph the Second so profoundly said, is the chief of the civil service. As to examinations'—and he looked at Sir Bernard with a quiet smile—'men of the world like yourself know perfectly well there are still many posts of a reserved character which the head of a department holds, and must hold, in his own gift personally.'

Sir Bernard gazed hard at him and smiled a mollified smile. 'Oh, you've found that out already, have you?' he murmured dryly. 'Well, you're a very intelligent and well-informed young man; I wouldn't object to you at all for a Secretary of Legation. A Secretary, as a rule, is another name for a born fool; they're put there by the F. O. on purpose to annoy one.' And he smiled a bland smile and nodded sagely at Gillespie. But no more was said for the moment about a post for Dick Plantagenet.

As father and son sat together at lunch, however, that morning in Edward Street, the Born Poet recurred somewhat tentatively to the intermitted subject. 'I wish, pater,' he said with assumed carelessness, 'you could manage to do something or other for that fellow Plantagenet. He's not a bad sort, though he's eccentric: and he's a real dab at history. He's been a *protégé* of mine in a way since he came to Durham; and though he gives himself mysterious airs on the

strength of his name, and is a bit of a smug at times, still, there are really points about him. He's wonderful, simply, on Henry the Second!'

Sir Bernard hummed and hawed—and helped himself reflectively to another deviled anchovy. 'This cook does savouries remarkably well,' he replied, with oblique regard. 'I never tasted anything better than these and his stuffed Greek olives.—Such places exist, of course, but they're precious hard to get. Special aptitude for the work—and very close relationship to a cabinet minister—are indispensable qualifications.—However, I'll bear it in mind—I'll bear it in mind for you, Trevor. I shall be dining with Sir Everard on Tuesday week, and I'll mention the matter to him.'

Whether Sir Bernard mentioned the matter to the famous minister or not, history fails to record for us. That sort of history goes always unwritten. But it happened at anyrate that by the end of the next week the Dean called up Gillespie after lecture one morning and informed him privately that a letter had arrived that day from a Distinguished Person inquiring particularly after Mr Richard Plantagenet's qualifications for the post of Assistant Decipherer to the Pipe-roll and Tally Office, with special reference to his acquaintance with legal Norman-French and medieval Latin. 'And I was able,' the Dean added, 'to enclose in my reply a most satisfactory testimonial to your friend's knowledge of both, from our two chief history lecturers.'

Gillespie thanked him warmly, but said nothing to Dick about it.

Three days later, a big official envelope, inscribed in large print, 'On Her Majesty's Service,' arrived at the door of Third Pair left, Back Quad, addressed to Richard Plantagenet, Esq., Durham College, Oxford. Dick opened it with great trepidation; this was surely a bad moment to come down upon his poor purse with a demand for income tax. But he read the contents with breathless astonishment. It was to the effect that the Right Honourable the Director of Pipe-rolls having heard of Mr Plantagenet as possessing a unique acquaintance with Norman-French documents, and an efficient knowledge of medieval Latin, desired to offer him the post of Assistant Registrar and Chief Clerk in his office, an appointment directly in the Right Honourable's own gift, and carrying with it a salary commencing at two hundred and fifty pounds a year, and rising by annual increments of ten pounds at a time to a maximum of four hundred.

To the family at Chiddingwick such an income as that was unimagined wealth beyond the dreams of avarice. Dick rushed off with the letter in hot haste to Gillespie, who received him with the quiet smile of a consummate confederate. 'The only thing about it that makes me hesitate,' Dick cried, with a strange moisture in his clear blue eyes, 'is just this, Gillespie—oughtn't the post by rights to have been put up to public competition? Mayn't I perhaps be keeping some better man out of it?'

Gillespie smiled again; he had been fully prepared beforehand for that quail of the sensitive Plantagenet conscience. 'My dear fellow,' he said, pressing Dick's arm, 'that's not a question for you, don't you see, at all, but for the Government and the legislature. If they choose to

decide that this particular post is best filled up by private nomination, I don't think it's for the nominee to raise the first objection—especially when he's a man who must feel himself capable of doing the particular work in question at least as well as any other fellow in England is likely to do it. I'm no great believer myself in the immaculate wisdom of kings or governments, which seem to me to consist, like any other committee, of human beings; but there *are* some posts, I really think and believe, that can best be filled up by careful individual choice, and not by competition; and this post you're now offered seems to me just one of them. If governments always blundered on as good a man to do the work that then and there wants doing—why, I for one would be a deal better satisfied with them.'

So, that very afternoon, Dick went down to Chiddingwick to bear news to Maud and his mother of this piece of good fortune that had dropped as it seemed from the clouds upon them. For he never knew, either then or afterwards, what part that wily diplomat, Sir Bernard Gillingham, had borne in procuring the offer of the post for him. If he *had* known, it is probable he would have declined to accept any favour at all from the father of the man who, as he firmly believed, had helped to kill his father. Maud's triumph and delight, however, were unclouded and unbounded; this event served to show the wisdom of her pet policy; but she seemed hardly so much astonished at the news, Dick thought, as he himself had expected. This was the less to be wondered at, because, in point of fact, it was not quite so novel to her as it had been to Dick; for at that very moment Maud carried in her bosom a small square note, beginning, 'Dear Miss Plantagenet,' and signed, 'Ever yours most sincerely, Archibald Gillespie,' in which the probability of just such an offer being made before long was not obscurely hinted at. However, Maud kept that letter entirely to herself; it was not the first—or the last—she received from the same quarter.

This change of front affected all their movements. As soon as term was ended, Dick went up to London to take up the duties and emoluments of his office. But that was not all. By Gillespie's advice—Gillespie seemed to take an almost fraternal interest now in the affairs of the family—Mrs Plantagenet and the children moved to London, too, to be with Dick in his lodgings. Gillespie thought Miss Plantagenet's musical taste so remarkable, he said, that she ought to be in town, where sound instruction could be got in singing; and he was so full of this point, that Maud consented to give up her own work at Chiddingwick and take a place as daily governess in London instead, going out in the afternoon to a famous vocalist. Gillespie believed they ought all to be removed as far as possible from the blighting memory of their father's degradation; and he attached so much importance to this matter that he came down once or twice to Chiddingwick himself during the Christmas vacation, in order to see them all safely removed to Pimlico. It was wonderful, Dick thought, what a brotherly interest that good fellow always took in all that concerned them; yet when he said so to Maud, that unconscionable young woman only blushed

and looked down with a self-conscious air that was very unusual to her. But there!—girls are so queer: though Gillespie had been so kind, Maud never once said a word, as one might naturally have expected, about how nice he had been to them. For his part, Dick thought her almost positively ungrateful.

THE SALT MANUFACTURE IN THE WEAVER.

THERE is a district of Cheshire, the Weaver Valley, that lies above a great basin of salt rock some twelve square miles in extent. The salt was deposited in the Tertiary period, and resulted from the evaporation of some salt lakes which communicated with the sea somewhere about where now stands the town of Liverpool. There are two main strata of rock-salt: the upper one lies one hundred and twenty feet below the surface, and is sixty-three feet thick; below that is a bed of impermeable marl, of an average thickness of thirty feet; and below that, again, another bed of rock of superior purity to that above, and measuring in depth about eighty-eight feet. The lowest rock-salt is alone mined; it is dry; but the peculiarity of the upper deposit is that on its surface are 'brine-runs'—that is to say, the rain and river-water soak through the gravel and gypsum deposits that lie above it, and reaching the salt, take up from it as much as they can hold in solution—that is to say, about twenty-five per cent. of salt.

These brine-runs are not all in connection; they lie as underground lakes above the salt rock. There are, however, places where the upper salt rock is dry, and where it was formerly mined. It is not so now. In the upper strata there are thin and inconsiderable salt beds, which were known to the Romans, and perhaps to the Britons; but the salt rock was not discovered till 1670, and the lower deposit not till 1770. In medieval times there were 'wyches' or salt-houses in the Weaver Valley, in which brine brought up in leather buckets on men's shoulders from brine-wells was evaporated over wood-fires in lead pans. Several noblemen had their salt-making houses at Northwich, Middlewich, and Sandbach; but salt does not seem to have been manufactured largely till the present century. At first, much rock-salt was mined where the upper rock was dry; and these old mines when the water got into them were deserted, and have become a source of great danger and mischief; for the water rapidly decomposes the salt rock, and as it is pumped out in the form of brine, fresh water enters and continues the decomposition. By this means the salt bed is being rapidly removed, and the natural consequence is that the country above it is subsiding.

At present, a million tons of salt are carried away down the Weaver Canal alone, and the amount that departs in salt trucks by rail cannot be much less than half that quantity. Consequently, the whole of one stratum that underlies the Weaver Valley and its towns Winsford, Middlewich, Northwich, and Sandbach, is being withdrawn, and the surface of the land is being let down below sea-level. It was given in evi-

dence, in May 1890, before a Select Committee of the House of Lords on the Widnes Brine Supply Bill, that in the Northwich district alone six locks on the river had been rendered useless through the subsidence of the land. A bridge was continually sinking, which had cost seven thousand pounds to build. In 1881 and 1882 it had gone down eighteen inches, and cost a further sum of two thousand one hundred and fifty-seven pounds to raise it. In 1887 it had again sunk.

But we will not consider the sinking of the land, but the method of manufacture of salt from brine.

The sole mines for rock-salt are now in the lowest and purest bed. The rock-salt is exported, much of it to the Netherlands and Australia, and its chief use is for mixing with food for cattle. The upper deposit is worked for table salt, and it is worked by water—that is to say, no mining in it is done by the hand of man; the agent for removing the salt rock is water. Fully-saturated brine contains twenty-seven pounds of salt in one hundred pounds of water. The best Cheshire brine is extraordinarily strong: it contains twenty-six pounds of salt in one hundred; whereas seawater contains only three and a half per cent. The Friedrichshall brine contains twenty per cent., and that of Château-Salines only fourteen per cent. Accordingly, the Cheshire manufacturers have a great advantage in the strength of their brine; and a second in the nearness of the great coal-fields of Yorkshire, Derbyshire, and Durham. They have the most strongly impregnated natural brine known where it is most inexpensive to evaporate the water.

If we visit a salt factory in the Weaver Valley, the first point to be noticed is the boring into the reservoir of brine. A shaft is driven down through the red marl and gravel, through beds of gypsum like masses of alum, till the reservoir is tapped; whereupon the brine rushes up the shaft. Then a pump is let down and hung in the boring. The iron pipe has nothing to rest upon below; it depends from its collar at the top. In the present autumn (1892), one such pump broke from its bearings and sank, never to be recovered. The brine pumped up is discharged into a large bricked tank, from which pipes of communication lead to the several pans in which the solution is to be boiled or scalded.

There are pans of two sorts, according to whether the salt is to be fine or coarse grained. In the former case, it is boiled; in the latter, scalded. Moreover, the size of the pans differs: those in which fine crystallised salt is to be made are not over thirty feet long by twenty-four feet wide; whereas the others are often double the length. The pans are eighteen inches deep. Under a pan for fine salt at one end is the furnace, and the fire and smoke from it are conveyed the whole length of the pan, and also under a chamber beyond in which the salt has to be 'stoved.' When the brine is in ebullition at the end immediately over the fire, it sends ripples to the farther end, and of course parts with its water by degrees in steam. As the steam forms above the pans, so do salt crystals form on the surface of the brine, as a sort of scum, at the end away from the fire. If this be not removed, in a short while it sinks; accordingly, men, locally termed 'wallers,' are engaged with

paddles raking the salt as it forms to the sides, where it is put into 'tubs'—that is to say, wooden forms of various sizes—80, 120, and 160 to the ton. The wallers are paid 2s. 1^{d.} to 2s. 3^{d.} per ton for making this salt. As soon as each tub is filled, it is left to drain; then, when drained, the salt block is turned out; with a wooden paddle it is shaped where bruised, and is then carried into the hot room to be 'stoved'—that is, thoroughly dried. Though in the pan-room it becomes sufficiently consistent to be handled, yet such is the amount of vapour in the air there that it still holds a considerable portion of water. Round the pans are hollow troughs eighteen inches deep, in which the men stand to fill the tubs. Each tub when filled is put on the 'hurdle'—the platform that acts as a terrace round the entire chamber and the pan.

It is in this part of the salt factory that accidents occur. The air is so full of steam that one cannot see where one is going. A small rib, two inches high, divides the hurdle from the 'stand inside,' and a trip on this rib may precipitate into the boiling brine. But sometimes a death may ensue through sudden giddiness, caused by the density of the vapour or the heat. Shortly before the visit of the writer of this article to one of the factories, a boy was sitting on the edge talking, when suddenly, from no explicable reason, he lost his balance, and fell over into the brine, and was scalded to death. Another case that had recently happened was that of a man. He had been a very bad character, going to night-work—the boiling is carried on night and day—and possibly with a drop too much in his head, he staggered and fell into the pan. He picked himself up, and, confused by pain or steam, he struggled forward into the middle of the pan instead of seeking the edge, and stood there in the boiling brine too stupefied to understand where he had got. He had to be drawn to the side with rakes. He lived for a couple of hours. When the surgeon told him to prepare for death—'Oh,' said he, 'while there is breath there is hope;' and these were his last words.

A question which has often arisen in the writer's mind has been relative to the agony of death by burning or scalding. Is it continuous to the last? He believes not. In one or two cases that have come under his notice, he has convinced himself that after the first spasm of anguish the pain is not felt in the same intensity. He asked this question of the foreman, who had witnessed several deaths by scalding, and he was of the same opinion.

Every ton of salt takes about thirteen hundred-weight of 'burgey' or good slack to make, and costs, all included, from 8s. 6d. to 9s. per ton. The tub salt formed as described is that which is seen in shapes in shops. When sufficiently dried in the stove, this is ascertained by a ringing sound they give out when struck.

Fine salt that is unstoved is called 'butter salt.' This is not put in moulds at all, but is tossed out to drain on the hurdles. The butter salt is sent away in vans or by boat, and shipped largely to the East Indies. The thoroughly dry salt would settle as hard as rock were that taken a long voyage. In the hot-houses for drying the squares, the spaces between the flues, that run

under the floor like a Roman hypocaust, are left uncovered, and are called 'ditches.' The men who throw the blocks out of these hot-houses and stack them in the rooms above are called 'ditchers.'

Owing to the intense heat of the works, the men go almost completely naked, wearing breeches or trousers only. They stream with perspiration, and will run out the barrows with butter salt to lade a van on the rails in this condition, and stand talking to each other in a freezing east wind. One would suppose that pulmonary complaints were frequent. This is not the case; the men enjoy excellent health, and almost entire exemption from influenza, cholera, and all fevers.

The next process is to make the fine table salt. For this purpose the conical blocks are run on barrows to the mill to be ground. A man with a pick tosses each moulded block on to a revolving band or elevator with catches on it to receive the blocks, which are carried up and thrown into the mill, where the salt is passed between smooth revolving plates of iron, crushed to the fineness required, then passed through sieves. Much of the table salt produced is as fine in the grain as the finest wheat flour. It is never touched by the hand. As soon as reduced to salt-dust, it is placed in jars, or waterproof bags, or parchment receptacles.

Ordinary common salt is not boiled at all, and is formed at a temperature of one hundred and seventy to one hundred and eighty degrees Fahrenheit. It remains about two days in the pan. It is the rule, the slower the evaporation the larger the crystals formed. This salt is never put into tubs, but is drained on the hurdles.

Fishing salt is made at a temperature of one hundred to one hundred and twenty degrees Fahrenheit, and remains about five days in the pans, sometimes as long as three weeks. It is a much coarser-grained salt, and is employed for pickling. Bay salt is coarser still, and is allowed some six weeks to form. It is made at a temperature of ninety degrees Fahrenheit; owing to the time it takes making, it is the most expensive of all. After the crystals have been drained, they are washed again in hot brine and then stoved.

Brine as it comes from the shafts is never pure; there is with the salt (chloride of sodium) as well some gypsum (chloride of lime), and this settles at the bottom of the pans. In order to purify the brine, there is always a little soft soap or gelatine introduced. A piece of soft soap the size of a walnut, or a piece of butter of the same size, will suffice to purify twenty tons of salt.

On account of the settling of the gypsum to the bottom of the pans, these pans have to be picked every three weeks; very generally, they are picked weekly. The scale is beautifully white, like snow, and hard as marble. It forms to the thickness of from two to three inches over the bottom, except immediately above the fires. Every salt-boiler has to pick his own pan without extra wages. A pan is spoken of as being 'fresh on pick' or 'old on pick,' according to the length of time since the scale was removed. The salt is conveyed from the factories by canal in 'flats' or in trucks by line, covered and uncovered. The trucks are costly articles, those covered being £102, 10s. each, and hold from six to seven tons. They are built at Chorley.

Table salt in bags is worth forty shillings a ton. There has been great fluctuation in the price of salt. Between 1845 and 1860, common salt fetched 7s. 6d. a ton. In 1865 it dropped to 6s.; but in 1872 went up to 20s. In 1873 it fluctuated between 15s. and 12s. During the American War it reached its lowest price, 3s. 9d. In 1881 it was 4s. 9d.; in 1891 it was 11s. 6d.; in March 1892 it had fallen to 9s.

The price of table salt is, of course, higher than that of common salt. In March 1891, 'handed squares,' eighty to the ton, were at 27s. 6d. and 23s. 6d. In March 1892 the price had fallen to 15s., and then to 13s.

In the reign of William III. a duty of five shillings a bushel, or about a penny a pound, was for the first time imposed on the salt in this country; in 1795 it was increased to 10s.; and in 1805 it was further increased to 15s., which gave rise to a good deal of smuggling. The mischievous effects of the high duty having been strongly represented to the House of Commons, the duty was in 1823 reduced to 2s.; and on the 5th January 1825 it was wholly repealed.

In 1852 in Cheshire there were 29 salt mines and 97 salt works, employing 8000 persons. And 200,000 tons were disposed of for manure, 300,000 tons for consumption in the United Kingdom, and 500,000 tons were exported. In 1858 the total produce had risen to 1,000,000 tons annually, of which about one-half was exported; and in 1881 the production was further increased to 1,854,000 tons. In 1890 the salt rock mined in Cheshire amounted to 159,000 tons, whilst the salt obtained from brine was as much as 1,958,000 tons.

The great bulk of brine-pumping stations of Cheshire, and indeed of the whole country, have been bought up, and are invested in the Salt Union Company, making enormous profits. Salt which in 1881 was selling at 5s. per ton ran up to 15s. The price has declined since, happily for the public. When the ring was formed, borings were made at Middlesbrough, in Durham, and salt was found at 2000 feet below the surface. Two shafts were sunk; into one, sweet water was pumped, and it was drawn forth as brine from the other. This station has since been acquired by the company.

Brine is employed not only for the formation of salt as a condiment, but it is likewise largely employed in chemical works for the production of alkali by the ammonia-soda process. Messrs Brunner, Mond, & Co. have large works of this description at Northwich.

Brine is also employed in the manufacture of bleaching-powder, chloride of potash, and muriatic acid, of which there is a factory at Widnes. This company purchased a piece of land in the salt district, and endeavoured to carry a Bill to enable it to lay pipes from the shaft they bored on their estate to Widnes, so as to convey thence the brine to their works. The Bill was strongly opposed, and was defeated in 1890, as it was contended that the exhaustion of the salt rock would cause serious subsidences without benefit to the inhabitants of the district.

The main Cheshire salt district is in the neighbourhood of Northwich, Winsford, and Lawton. At Middlewich and Nantwich, although brine springs are present and salt has been manu-

factured for centuries, yet hitherto no salt rock has been reached in borings carried to the depth of four hundred feet.

As already said, the upper salt rock was discovered in 1670; but in Doomsday Book there is mention of the wyches or salt-houses in Northwich. With the discovery of the rock, the importance of the district grew; and the Weaver, an insignificant river, within the basin of the salt district, was taken in hand, and in 1721 an Act of Parliament was obtained to deepen the river so as to make it navigable. Before the discovery of the rock, when the brine was got up out of wells, Michael Drayton, in his *Polyolbion*, written well nigh three centuries ago, commemorated in verse the connection of salt with the Weaver. He says:

To Weaver let us go,
His fountain and his fall, both Chester's rightly
born,
The county in his course, that clean through doth
divide,
Cut into equal shares upon his either side.
And what the famous flood far more than that
enriches,
The brackly fountains are these two renowned
Wyches,
The Nantwich and the North, whose either briny
well
For store and sorts of salts made Weaver to excel.

THE IRONY OF FATE.

By T. E. SOUTHEE, Author of *A Haunted Memory*, &c.

CHAPTER I.—AFTER THE BALL.

THE ball was over, the guests had departed, and Arabella Alsworth was alone in her dressing-room. It was a handsome and luxuriously-furnished apartment, and the bright fire that burned in the grate made it look cosy and comfortable. She was standing with her elbow resting on the mantel-piece, looking in anything but a pleasant humour. She was surrounded by all the comforts and luxuries which wealth could purchase or the heart wish for; and these, and the floods of adulation and flattery which had been poured upon her that night, ought to have made her happy; but it did not, and there was a shade on her fair face which told a very different tale.

She was tall and graceful, with a splendid contour of both face and figure. She stood there with her masses of golden brown hair drawn back from her broad white forehead; her calm blue eyes, so deep and clear, fixed vacantly on the bright coals in the grate, while her tender mouth seemed to tremble with strong emotion.

The poor girl was looking back into the past, to another night and another ball, when she and Frank Wallis, a young naval Lieutenant, had left the heated room and strolled into the conservatory. How well she remembered the calm beauties of that never to be forgotten scene! The blue heaven above, with its myriads of stars; the hushed murmur of the soft west wind as it rustled among the leaves; the musical plash of the fountain, and the soft harmony of the music from the ballroom. It all came back to her like a dream.

Up to that time she had known nothing of the joys and miseries of love. She was happy.

The present was all in all. It was only when the time had come for Frank to join his ship that the light broke in upon their hearts, and the warm tide of passion swept the veil from their eyes. There, in the soft morning twilight, under those bright stars, which had so often listened to lovers' vows, they plighted their troth, and the hearts which Nature had linked together were bound the one to the other by the most solemn promises of love and loyalty.

Like an honest man, the young Lieutenant had immediately gone to Mr Alsworth and laid the case before him. But he only laughed and pooh-pooled the idea. They were children, and, as he was only a penniless Lieutenant, if they got married how were they to live? This was a question the gallant young gentleman was not prepared to answer, and, as the old gentleman imagined, went away with a flea in his ear. But Arabella was of opinion that she ought to have a voice in the matter; and when she was told by her father, with a considerable amount of glee, how he had posed the Lieutenant with the financial question, she astonished him by exclaiming: 'Oh! you mean old pappy, how could you be so cruel? Just as if you had not got enough for all of us!'

It was while she was recalling all this, lost in a deep but not altogether unpleasant reverie, that the door opened, and Miss Mortimer, Arabella's aunt, a maiden lady who, since the death of the late Mrs Alsworth, had presided over the domestic arrangements of Netley Lodge, entered the room. 'What! not undressed, Bella!' she exclaimed.

'No,' was the reply; 'I was thinking and meditating.'

'And what was the subject of your meditations?'

'I was thinking what a nuisance it is to be rich!'

'Gracious, child! you must be mad!'

'No. If I were not supposed to be a rich heiress, I should not be pestered, as I am now, with offers of marriage by men I don't care a fig for. It would be more bearable if I could fancy it was I who am the attraction, and not papa's money.'

'My dear Bella!' exclaimed Miss Mortimer, 'you make a great mistake. How is it possible that any one should fail to love you for yourself? Are you not young, beautiful, and clever?'

'But how am I to know that? You see, papa is rich—that is the cause of all my trouble!'

'Foolish child! How can riches be productive of unhappiness?'

'In my case it is easily explained. Papa wants me to marry men without my loving them, and I want to marry the man I love. If papa were poor, I should be allowed to choose for myself.'

'Perhaps,' said Miss Mortimer, in a slightly sarcastic tone, 'if you were really the daughter of a poor man, you might not get married at all; people cannot live on love!'

'No, I suppose not,' replied Arabella; 'but in that case there could be no base motive to inspire love. If I were poor, I should not be less handsome or less clever; and yet, as you very well know, I should not have half the lovers I now have. Perhaps, like that poor Miss

Pilkington, the governess, who is certainly as good-looking and clever as I am, none at all.'

'Well, my dear, I'm sure I don't know what is to be done for you, unless, indeed, your papa were to speculate in railways or something of that sort and lose all his money.'

'I'm not quite sure that I should like *that*,' said Arabella musingly; 'but it has given me an idea. What I should like would be to pretend that papa had lost all his money, then we should soon see who were our real friends, and who were the worshippers of mammon.'

'My dear Bella! I'm surprised at you—you who pretend to be such a lover of truth. Don't you see that that would be deceiving people? It would be untrue.'

'Now, aunty,' cried Arabella, 'that's unkind! Why, when I remonstrated with you because you told James to tell the Miss Scudamores you were not at home, when you were, you said that it was only a white lie, and that white lies were permissible in polite society.'

'But I did not tell the lie myself; I only instructed James. It's a sort of polite fiction we all understand.'

'Just so. You don't like to tell lies yourself; but you compel your servant to do so. How funny you would look if the next time you instructed James to say you were not at home, he were to turn round and say, "Beg pardon, ma'am, but that's a lie, and I can't tell it."'

'Dear, dear child, what a fuss you are making about nothing!'

'Nay, nay, aunty; the boot is on the other foot. I merely suggested that it would be good fun to pretend I was afraid that papa had been speculating, and so forth. For instance, if I were to give the smallest hint to the Miss Scudamores, you would soon see how they'd set the ball rolling, and how, like the snowball, it would gain in size and force as it circulated.'

Miss Mortimer shook her head. 'Suppose it came to papa's ears, what would he say?'

'Oh! if it did, I could soon put that right.'

'Dear, dear child, I wish you had not told me. The very idea of such a thing!'

'Yes, the idea's a splendid one. I'll hint that we shall be obliged to retrench; and I'll persuade papa to take us to Paris, and then I can be ill, or something, and we'll go to the south of France. That's it; that will do beautifully!'

'Bless me! bless me!' cried Miss Mortimer, 'what a girl you are!'

'Yes, that's lovely!—And now, aunty, go to bed and sleep on it.'

Miss Mortimer did as Arabella bade her; most people did. The thought even of pretending to be poor was distasteful to her; but Paris and the south of France made a deep impression on her; and in the end, as far as she was concerned, there seemed a fair chance of Arabella's having her way, that is, provided she was in the same mind when she awoke the next morning.

With such a grand scheme in her head, it will not be any matter of surprise that she did not sleep well, and that when she did, she dreamed that she had sent all her lovers to the rightabout, and a number of other strange and wonderful things.

Of course it was very late when the two awoke, and consequently it was past twelve before they

had finished their breakfast. At this point the two Miss Scudamores were seen coming along the drive; and a few minutes afterwards the door-bell rang and they were ushered into the drawing-room.

'There now, aunty,' exclaimed Arabella, 'you see everything seems to favour us. Papa is gone off to London, and here are our advertising mediums ready to publish anything we may supply them with.' And with this she started off to the drawing-room.

'My dearest creature!' exclaimed the elder visitor, rushing forward and kissing Arabella, 'what has made you so late? It's nearly one o'clock. We called about eleven, but you were not up.'

'I'm really very sorry,' replied Arabella; 'but it was late when we got to bed, and I did not get a wink of sleep till after daylight.'

'Poor darling!' cried both ladies in a breath; and then Aunt Betsy made her appearance. 'Have you heard the news?' cried both sisters at once.

'No; what is it?' exclaimed Miss Mortimer, who was not at all averse to a bit of scandal.

'And you really have not heard of it? You who know the family so well!' replied Miss Scudamore, who delighted to play with her auditors. 'Can't you guess?'

'No; how can I!' exclaimed Arabella.

'Well, then, as I see you are wild to know, I'll tell you! There's a full account of it in the newspaper. Blankhorn's Bank has gone all to smash!'

'Dear, dear! I'm so sorry. Blankhorn's Bank failed! Surely the world must be coming to an end!' moaned Miss Mortimer.

'I hope you will not be a—be a loser?' queried Miss Scudamore.

'Not to a great extent. I'm exceedingly sorry, more for the family than for myself.'

'So am I,' answered Arabella gravely. 'I do hope papa is not compromised in their affairs!'

'Well, I hope things will not turn out so badly as you seem to think,' remarked Miss Mortimer. 'It does not do to make light of other people's misfortunes, for one never can make sure of not getting into a mess one's self. I remember once having some shares in a concern, only five twenties, producing about fourteen or fifteen pounds a year, clear of income tax; and do you know that for the sake of that paltry sum I was liable to have lost my whole fortune, every penny! Lucky for me, the shares got up to a big premium, and Mr Alsworth advised me to sell out. Three or four months afterwards, the concern burst up, and the directors were sent to prison.'

'It's really very serious,' said the younger Miss Scudamore. 'I read the leader in the *Times* yesterday, and it said the trade of the country was under a cloud.'

'Yes,' chimed in Arabella; 'and when it bursts, it will deal ruin and destruction on all sides.'

'Bless me!' cried the elder visitor, 'I did not see that! Do you think it can be true?'

'Certainly,' exclaimed Arabella, in surprise. 'Why, it's printed in the newspaper!'

'But all is not true that is printed in the newspaper,' observed Miss Scudamore.

'Not in the penny newspaper,' said Miss Mortimer; 'but in the *Times* it is different. I've often heard Mr Alsworth say that he would pin his faith on what the *Times* says.'

'I suppose,' put in Arabella, 'you would not believe it if you saw my father's name in the list of bankrupts?'

'Your papa! Certainly not! Impossible!' cried both ladies in a breath. 'But of course, dear Miss Alsworth, you are only joking?' concluded Miss Scudamore.

'No; I'm not,' returned Arabella. 'I assure you I am very uneasy about papa. I know he has been speculating a good deal lately, and in these days fortunes are soon lost!'

'But, my dear, your papa is so immensely rich!' said little Miss Prudence; 'it would take a lot to break him.'

'Ah!' sighed the young hostess, 'I see you do not believe me; but when you see a great black board erected on the lawn, announcing that this elegant mansion and grounds are to be let furnished for a term of years, you will understand that what I am now saying is no joke.'

By this time the two visitors were getting very uneasy. They were anxious to be off to propagate the astounding facts they had just been made acquainted with; so they said good-bye and hurried off.

'I think you've done it now,' said Miss Mortimer, when the two visitors had departed; 'but if it should get to papa's ears, what will he say?'

'I'm sure I don't care,' replied Arabella. 'I said nothing of a positive character. It's as good as a play.'

CHAPTER II.—BLACK FRIDAY.

The cloud which had hung over the commercial world had burst, and, as Arabella had unconsciously prophesied, had dealt ruin and destruction on all sides. The great firm of Overend, Gurney, and Company had collapsed, with liabilities amounting to more than ten millions. The day following 'Black Friday,' the crisis became more intense, and failures and stoppages of payment were announced on all sides.

Mr Alsworth, who had been reading the *Times*, suddenly put it down and rang the bell. 'Bring me my overcoat and hat, James,' he said to the footman who had entered the room. 'I want to catch the ten-twenty train.' When the man had brushed his hat and helped him on with his coat, he said: 'Tell Miss Mortimer I shall be back to dinner;' and he hurried off.

'Do you know where your master is going?' asked Arabella, who had seen her father hurrying down the drive.

'No, miss; but I suppose he's off to London,' the man replied.

'Aunt,' said she, when she had returned to the morning-room, 'papa's gone to London again. What can he want to be always going there for?'

'Impossible to say, dear; about this horrible money business. I wish he'd done as I did, and invested all his capital in consols; you get less interest, but then you have no worry as to its safety.'

'I'm sure I wish this dreadful crisis would

come to an end. Papa looks quite ill with all this excitement and anxiety.'

'Dear me! What can it be? Such a crowd!' cried Miss Prudence, who was standing at the window.

Miss Scudamore rushed to see what it was. 'It's an accident or something,' she suggested. 'And there! That's a body on the stretcher. Who can it be?' Then she rang the bell, and a smart little servant-maid made her appearance. 'What is the matter, Jane?' she asked.

'Nothing as I knows of, ma'am,' she answered. 'There's a body just been taken past. Go and ask some one who it is.'

Jane went to the door; and when she came back she was as white as a sheet. 'Oh! ma'am, it's dreadful! Why, I saw him go past this morning, and he looked as well as ever!'

'But who is it, girl? Can't you tell us?' cried Miss Prudence angrily.

'Mr Alsworth, ma'am!' replied Jane with a gasp.

'Mr Alsworth!' iterated Miss Scudamore in mingled tones of astonishment and incredulity.

'Yes, ma'am. They say he's had a fit.'

'Good gracious! how dreadful!' said Miss Prudence, as the two sisters stood staring at one another in blank astonishment.

'I can't believe it! It can't be true!' at length exclaimed Miss Scudamore. 'It seems impossible!'

If, in the midst of a bright summer day, a thunderbolt had fallen at the feet of Arabella Alsworth and her aunt, or a volcano had suddenly sprung up in the middle of the lawn and belched forth fire and lava, they could not have been more startled and alarmed than when they saw the policemen open the gate and slowly approach the hall door, bearing a body on a stretcher. They stood at the window, apparently spellbound. The men put down their burden, and one of them ascended the steps and rang the bell. The hall door was opened, and the body on the stretcher was admitted.

'What can it mean, aunty?' asked Arabella.

'Death, my dear,' she replied.

'But who can it be? Not papa, surely?' she said in tones of horror.

'Who else can they be bringing here?' asked the aunt.

The girl's cheeks blanched with horror, and she threw herself into her aunt's arms and burst into a flood of tears.

At this moment, Mr Fitch, the family doctor, came bustling up the drive, and was about to be taken up-stairs, when Arabella darted into the hall and accosted him. 'Oh, doctor! what does it all mean? Is he dead?' she asked tremulously.

'Dead! Oh dear, no; I hope not,' he replied.

'How did it happen?'

'I don't know any more than you do. All I know is that your father was found in a railway carriage in a state of insensibility;' and so saying, he sprang up-stairs to attend to his patient. He found him much worse than he had anticipated. He bled him, and applied all the remedies usual in such cases; and for the

present they seemed to remove the more alarming symptoms; but he freely confessed that he thought the case a bad one, and suggested that a London physician should be sent for.

'I can give no positive opinion,' he went on to say; 'one can never tell what turn these disorders may take; but I think, or rather I hope, he will pull through.'

The London physician came the next morning, and the opinion he gave only confirmed that given by Mr Fitch. The delirium had considerably increased, and was of the worst and most alarming kind, which, the doctors said, too often, if it did not issue in death, left the brain so much disordered and weakened as to impair its functions for the rest of life. The most undivided attention was required to keep the patient quiet, and to apply the remedies necessary for cooling and tranquillising the brain.

It was at this point that the cause of Mr Alsworth's sudden attack was discovered. He had as usual been reading the *Times*, and had come across a paragraph headed 'ABSCONDING OF A WELL-KNOWN STOCKBROKER—ENORMOUS DEFALCATIONS.' It stated that 'much excitement and consternation had been experienced on 'Change in consequence of its being reported that several large cheques drawn by Mr Archibald Sinclair, the well-known stockbroker, had been returned marked "No effects." It was at the same time ascertained that his offices were closed, and he himself had disappeared.'

This was the man who had sold Mr Alsworth's bank shares; and when he had read this, as we have already seen, he rang for his hat and coat and made his way at once to the railway station, caught the ten-twenty train, and proceeded at once to London. He went straight to his bankers, but only to find that Mr Sinclair's cheque for twenty-seven thousand pounds had been dishonoured, and that the drawer had decamped with the money.

The whole thing had been a great shock to Mr Alsworth; and this, and the excitement in consequence of his loss, brought on a fit of apoplexy, which it seemed would probably result in his death.

When Arabella discovered, from a letter written by her father's lawyer, the loss of this large sum, she was dismayed beyond measure. It seemed to her utter ruin. She had no idea of the amount of her father's fortune; but twenty-seven thousand pounds, besides other losses, which he had previously spoken of, must, she thought, reduce them to the verge of poverty. It was true there was no immediate want of money, for in her father's *escritoire* she found a matter of two hundred pounds or more in notes and gold. It was the future she thought most of.

There was one idea which would protrude itself into her mind—it was, that this was a judgment sent to punish her for her levity in setting on foot a false report of her father's losses. But, amid all her crosses and trials, there was one thought that was to her a consolation and a joy—it was that she had one, true and loving, on whom she could depend, and in whom she could trust. Come what might, she knew that her sailor-lover would not desert her; but he was away in a far-off African station, and could be

of no assistance to her in her present strait. Her aunt was no woman of business, and, except in the household arrangements, was quite useless.

She had no friend to whom she could apply for advice or assistance but her uncle, and he lived in Devonshire, just the opposite extreme of the kingdom; so that though she had written to him the day following her father's attack, she did not expect to see him for a couple of days at least.

It was the third day after her father's attack, and Mr Fitch's report that morning had been anything but favourable. She was sitting by the window indulging in a tender reverie, when the footman entered the room and said: 'Oh miss, Mrs Simson thinks master's worse.'

'I will come to him directly,' cried Arabella, much alarmed; 'and, James, you may as well go and see if you can find Mr Fitch and bring him here at once.' She hastened to her father's room, and went to his bedside, and sat down to await the arrival of the surgeon, who was not long in making his appearance.

Mr Alsworth was totally oblivious of all around him—talking wildly and incoherently, and insisting that he must start for London at once, as, without his aid, they would never catch that rascal Sinclair. All attempts to soothe and pacify him were vain. His delirium was such, that it was plain all real communication between his mind and that of any other person was at an end. Now and again he opened his eyes and stared about him in a vacant manner. It was a dreadful spectacle, for it was evident that he recognised no one, not even his daughter.

Mr Fitch shook his head. He directed that all that could possibly be done to tranquillise the pain should be done, but he gave no opinion. All that he said was: 'He has a very strong constitution, and he's under sixty, so that there is a chance for him yet.'

So the day passed, and night wore on. It was rough and stormy; the wind howled in the chimney, and the rain pattered against the window.

The delirious ravings had ceased, and the patient lay still and quiet; occasionally the eyes opened with a vacant stare, and then closed again. From this comatose state he never awakened; and so the spirit passed away.

THE SIGN-MANUAL.

To all legal documents the formula appended runs, 'As witness my hand,' a form of attestation which in the present day means that the document has been duly signed in the presence of witnesses, but which probably dates back to a time when writing was unknown, and when the real hand of the witness was stamped upon the document by means of paint, generally red ochre, to testify to all who looked upon it that such and such an act had been performed.

The documents of those days did not consist of paper and parchment, but generally of rocks and stones, although sometimes sheets of bark or buffalo hides were employed for the purpose. Hundreds of these attesting hands are found in

various parts of the world; sometimes placed high up on apparently inaccessible rocks, and surrounded by numerous hieroglyphic devices, which are doubtless historical records, now lost to the world for lack of a key to their interpretation. There are also hands in various positions, sculptured among the Egyptian, Hamath, and Mexican hieroglyphics, the meaning of which may perhaps be discovered through a knowledge of sign-language, for the language of the hand is as eloquent as that of the eye, and more easily transferred to pictographs.

Perhaps the most interesting notice of the use of the sign-manual among uncivilised peoples is that given by Catlin in his account of the burial of the Red Indian chief Blackbird. When this famous chieftain died, he was dressed in all his warlike paraphernalia, placed upon his favourite white steed, and, accompanied by all the chief men of his tribe, was led to the top of a hill, where, after various ceremonies, each headman present covered his hand with red paint and stamped it upon the white horse; then they brought earth and stones, and piled them round the living horse and his dead rider till both were buried deep in a great mound of earth; and so the chief was sent to the spirit world fully accounted for war or hunting, with his good steed beneath him, and the red hands of his lieges to testify that they had been witnesses of his solemn obsequies, and had done their duty by him in thus providing for his wants in another world.

Sir Edwin Arnold in his *India Revisited* speaks of the use of the sign-manual both painted and engraved in India. He says: 'The tank at Amedabad covers seventy-two acres, and is one of the largest in India. On a temple near its farther extremity was stamped the impress of a hand in red ochre, which marks where a Suti had perished in the flames. The gates of cities and the walls of burning ghats often bear the same token.' And again he writes: 'Half-way up the ascent to the holy hill [Poona] is seen a stone memorial of a Suti with the usual hand, arm, and footmark engraved, which show that a Hindu widow here immolated herself.'

The hand in the instances given above signifies or is associated with death; but Squier, writing of painted rocks in Nicaragua, says: 'The red hand is frequently repeated, as in Yucatan, representing there Kab-ul, the author of Life, and god of the working hand.' But whether denoting life or death, it is undoubtedly always employed as a witness, whether of creation or destruction, denoting that the owners of these painted or engraved symbols were present at such an event, and leave to posterity their hands as a token thereof.

Strange it is that this ancient prehistoric use of the hand should have descended to this nineteenth century to be now used as a scientific register of identity; yet so it is. Mr Francis Galton has for a long time been engaged in studying the markings of the finger-tips when transferred to paper, and has given to many learned Societies the results of his investigations. He finds that the markings of the fingers are never

alike in two persons, that they retain from infancy to age the same markings, varied only by the growth of the individual; so that the impression of the two thumbs of man, woman, or child may be more confidently relied upon as a witness of identity than any handwriting or other testimony; and he declares that had Roger Tichborne left the impression of his thumbs behind him, the Tichborne trial would have been impossible. Mr Galton, however, is not the only worker in this scientific inquiry into finger-marks, for Dr D'Abundo has been studying the subject as of great importance in determining mental capacity. He finds that generally the finger-tips of idiots, instead of varying as those of sane people do, show almost the same markings on all the fingers, and are remarkably smooth, making it difficult to obtain a clear impression. He also found that the thumb-marks of one idiot reproduced almost exactly those of his mother. These researches, trivial as they may seem to the unscientific, will probably lead to great results in the detection and identification of criminals; and perhaps, also, as foreshadowed in Dr D'Abundo's memoir, in the determination of the doubtful sanity of suspected individuals.

This method of identification by thumb-marks is, however, far from being new, for it has been in use for many years in India, where native criminals before their discharge from prison are made to impress their thumbs on the prison register, and can thus be readily recognised if recommitment. In China, also, probably from time immemorial, a similar mode of identification has been and still is in use; and a writer in the *Illustrated London News* last year described the signature to a Chinese passport as consisting of the impression of the hand of the bearer covered with oil-paint, transferred to damp paper, or sometimes of two thumbs only. This is one proof among many of the superior observation of that singularly ingenious race.

There is also but a step between this new science and that very ancient gypsy form of divination known as Chiromancy, or in modern parlance Palmistry. It is evident that if the finger-tips can be relied upon as a witness of identity, the whole hand must be still more reliable as a register of individuality; and if the slight convolutions of the thumbs and fingers denote sanity or imbecility, the deeper markings of the palm of the hand may, and probably do, register the mental and moral calibre of their owner. Whether they can also be made to prophesy of future events, or record the past, must remain doubtful. That they should do so seems most improbable, for if the markings remain the same during life, a record of events thus born with the individual, and as regards marriage, for instance, intermingling intimately with the lives of others, would savour too much of predestination to be accepted by any one who regards man as in any way a free agent. The subject, however, is a curious one, and likely to become much more prominent in the near future, since it has been lifted out of the darkness of superstition into the light of scientific inquiry; and it seems within the bounds of probability that the prehistoric sign-manual may be reverted to, and that at least the impression of the two thumbs may be required to be attached to all

legal documents; instead of or in addition to the usual signature, a duplicate impression being kept as a family register, thus entirely doing away with the risk of forgery.

THE VISION OF CHARLES XI.

'It is not probable,' said Dr Johnson, 'that two people will be wrong the same way.' But although we cannot accept the above as an axiom—for in that case we should have to accept a great many things beside ghosts and sea-serpents as not improbable—still the saying is not without weight. Wrong we may be—wrong we are, but not wrong in the same way exactly. 'Presentiments are strange things, and so are dreams,' says Currer Bell. 'I never laughed at one in my life.' It is chiefly other people's presentiments, perhaps, which we try to laugh away. Our own, we are usually more tender over. It is an old superstition that 'the arrow seen beforehand slacks its flight'; so we are willing to keep a sharp lookout for any that fortune may be aiming at us unawares. The shadow which a coming event casts on our path is commonly believed to be not so prophetic of immediate imminent danger, or death, as that unaccountable elevation of spirit which has been known, time out of mind, to fore-run a catastrophe. 'My bosom's lord sits lightly on his throne' is now a warning rather than a gratulation; for Shakespeare himself tells us 'that against ill chances men are ever merry.'

But to return to Dr Johnson's saying, that it is not probable two people will be wrong the same way. In the instance of 'a coming event' which we are about to relate, it was not two people that were 'wrong the same way'—that is, if they were wrong at all—but four, and one of them was credited with having as little imagination as a Dutch alewife or an English beef-eater. The father of the heroic Charles XII. of Sweden is known in history as one of the most despotic monarchs that ever ruled that country. His temperament was cool and inflexible; his mind enlightened, brave, and essentially practical; and he was firmly attached to the Protestant religion.

On an autumn evening, shortly after the death of his wife Ulrica—a Princess, by the way, whose days were said to have been shortened by his harshness—Charles XI. was sitting before a large fire in the library of his palace at Stockholm. Day by day since his bereavement he had grown more gloomy and taciturn, devoting himself to affairs of State with an industry that bespoke a mind ill at ease. On the evening in question his companions, or attendants, were but two—his favourite Chamberlain, Count Brahé, and his Doctor, Baumgarten. The latter had the reputation of being a sceptic in everything except his own art. The evening wore on; yet the king, who usually retired early, made no sign to his attendants to leave him. With his head sunk deep on his chest and his eyes fixed on the glowing embers, he maintained a profound silence. The Chamberlain had hinted more than once that His Majesty needed repose. Charles signified dissent by a gesture only. Baumgarten ventured at last to speak of the harm vigils bring even to the robust.

'Stay where you are; I am not sleepy,'

muttered the monarch through his clenched teeth.

Several attempts to get up a conversation between the pair of attendants followed, each a more dismal failure than its predecessor. The king was evidently in one of his blackest moods, and the courtiers' task both delicate and difficult.

Brahé, thinking he had fathomed the cause of his sovereign's gloom, gazed fixedly at a portrait of Queen Ulrica that hung above the mantel-piece. Heaving a deep sigh, he said: 'What a splendid likeness!—the mingled dignity and sweetness'—

'Bah!' interrupted the king rudely; 'it is much too flattering. The queen was plain.' Then, as if vexed with himself, he rose and walked about the room, endeavouring to hide feelings of which he was ashamed.

The present palace of the kings of Sweden was not in existence in those days. Charles XI. lived in the old palace at the end of the Ritterholm, facing Lake Mælar. This huge edifice was built in the shape of a horse-shoe; the king's library—from the window of which Charles was now looking—was at one end of the curved wing; the Hall in which the Swedish Estates assembled to receive a message from the Crown was at the other. To the king's surprise, he perceived this Hall to be illuminated. The light might proceed from a servant's flambeau; but what could a servant be about at such an hour in such a place? The Hall had not been opened for months; moreover, the light was too brilliant to come from a single flambeau, and too steady and without smoke for a conflagration. The king gazed at the spectacle some moments in silence, then he summoned his companions by a word to his side. 'What—who is yonder?' he said, pointing to the illuminated windows opposite.

Each declared himself wholly unable to explain or understand the sight; and the Chamberlain would have rung for a page to go and learn its cause, had not the king stopped him.

'I prefer to learn it for myself,' he said; and though his cheek was pale and his face troubled, his step was firm as he left the library, preceded, at his command, by his two attendants, each bearing a light. The warder, an old man, had retired to rest some hours; and his surprise was great when Count Brahé roused him to desire that he would open for the king the door of the Council-chamber immediately.

With a bunch of keys he was soon in readiness, and, at the king's bidding, opened without delay the door of a long gallery leading to the Hall. As they entered it, all stood still: the walls from floor to ceiling were draped in black.

'Who ordered this?' demanded Charles in an angry voice.

'No one, sire,' stammered the warder in amazement. 'All was as usual a week ago, when I swept the gallery; and those hangings'—he turned from them to gaze on the king steadfastly—'they never were in Your Majesty's Store Chamber.'

Charles walked rapidly forward without speaking, closely followed by his three attendants. As they neared the Hall, a brilliant shaft of light shot beneath the double leaves of the great oaken door.

'In God's name, sire,' cried the warder, holding back, 'go no farther! Here is sorcery!'

'Stop, sire!' urged the Count at the same moment. 'Who knows what danger you are braving!'

'Permit me, at least,' added Baumgarten in tremulous tones, 'to fetch hither a company of Your Majesty's grenadiers!'

'Silence!' said Charles sternly.—'Open this door, warder, at once!'

The old man endeavoured to obey, but his fingers shook so that he could not—or perhaps would not—fit the key into the lock.

'An old soldier, and afraid!' said Charles with scorn.—'Come, Count, undo this door for me!'

'Sire, bid me march to the mouth of a German cannon, and I will not hesitate,' protested Brahé; 'but to defy the powers of hell!'

The king snatched the key from the warder's shaking fingers. 'I see,' he said, 'I must be my own seneschal.'

In a moment he had fitted the key, turned it, and thrown wide open both leaves of the ponderous oak portal.

The Hall was ablaze with countless lights; and here, as in the gallery, the old figured tapestry was replaced from roof to floor with hangings of the deepest black. Flags and ensigns hung round the Hall, the trophies of the victories of the great Gustavus—Danish, Russian, and German; but wherever a Swedish flag appeared it was draped in funeral crape. The Hall was filled by a vast assembly, the four Estates sitting in due order of precedence on their accustomed benches, as it appeared, and every person was in deepest mourning. Yet, brilliant as was the light, their pallid faces shone so bewilderingly against the sombre background, that neither of the four witnesses of the scene was able to distinguish a single countenance. Seated on the throne was a blood-stained corpse, arrayed in the robes and decked with the insignia of royalty. At its right hand stood a child, crowned, and bearing an orb and sceptre in his hand. At its left, and leaning for support against the throne, was the phantom of an aged man. Seated at a table beneath the throne were men like judges, robed in black; and between them and the first row of benches stood a block, covered with crape; an axe lay beside it. As the king and his attendants gazed in speechless amazement at the spectacle, the oldest of the judges rose and smote the volume on the table before him three times with his shadowy hand. A side-door opened, and youths richly appressed and of noble carriage entered. All had their hands bound behind their backs. A thick-set man in a leathern jerkin followed, holding in his hands the ends of the ropes that bound them. As the youth who entered first halted in front of the block—which he seemed to regard with a proud disdain—the corpse on the throne was seen to tremble convulsively. The young man knelt and stretched out his head—the axe flashed—the head fell, rebounded and rolled to the feet of Charles. Hitherto he had stood motionless; but at this fearful sight, the king, gathering his energies, pronounced in a loud voice the formula: 'If ye are of heaven, speak! If of hell, depart, and leave us in peace!'

At the sound of his voice the figures before

him waned and faded, taking the appearance of coloured shadows ere they vanished altogether. Then a voice was heard crying: 'Woe! woe! woe to the House of Vasa!' As it ceased, the mysterious lights disappeared, and those still carried by the Doctor and the Chamberlain fell upon nothing but the empty Council-chamber, its ancient tapestry lightly shaken by the night-wind. A faint sound—resembling, according to one of the witnesses, the vibration of a harp-string broken in the tuning; according to another, the sighing of a breeze among pine-trees—still lingered a short time in the apartment. All agreed as to the length of time the apparition had, lasted—that, from beginning to end, it could not have been sustained less than ten minutes.

When the king and his companions regained the library, Charles remained some time lost in thought; then he dictated a precise account of what had been presented to him; his attendants signed it, he also.

Although every precaution was taken to prevent the contents of this document getting abroad, yet even in the king's lifetime they became known. The document itself is said to be still in existence, nor, so far as we are aware, has its authenticity ever been doubted. It ends in the following solemn words: 'If what I have here set down is not the exact truth, I renounce all hopes of that better life which perhaps may be vouchsafed to me for some good actions, and above all for my zeal in working for the happiness of the people entrusted to my care, and in defence of the religion of my forefathers.'

If the circumstances of the death of Gustavus III. and the execution of his assassin, Ankerstroem, be compared with the prophetic vision, they will be seen to correspond closely. The child standing by the royal corpse would be his son and successor, Gustavus Adolphus IV.; while the old man supporting himself by the throne would be the Duke of Sudermania, Regent, and, after the deposition of his nephew, the king of Sweden.

FOOTBALL IN MAORILAND.

ON the door of the Public Library of the little town of Ohinemutu, the capital of the Hot Lake District of New Zealand, were posted up two notices, one of a match that afternoon between the Rotorua Football Club and the Jubilee Team. I had often heard of the prowess of the Maori footballers since their visit to this country, and resolved to be present. The other notice was somewhat curious. It requested all to take note that the steam launch was forbidden to land passengers at any place on the Lake of Rotorua, 'because it ignores and tramples upon the chief and tribes and the Native Committee of Rotorua.' It was signed by a chairman with a long name, unpronounceable until slowly dissected, on behalf of the 'Great' Native Committee of Rotorua. To add to the formality, there was a small attempt at a seal. It was just the old story of fleecing the tourist, so common to the European districts where that class abounds. This little agitation, however, ended in smoke, the Maoris being brought to a proper comprehension of the fable of the fowl and its golden produce.

The first indication of something unusual was the riding through the town of some half-dozen Maoris, their jackets flying open, displaying their football jerseys, with bands of blue ribbon across like to what may be seen at footraces in this country. They were all well-dressed and handsome men, most of them with more than a touch of white in their colour. Leaving the *Lake Hotel*, I wended my way past the Maori Curiosity Shop and a few Maori huts, out on to the open plain on the road to Oxford. After passing the hotel, a large cloud of steam arises from a patch of tall manuka scrub, betokening the presence of the pools of boiling water for which the district is famous. Paths lead through the scrub and between the pools; but it is a veritable pilgrim's progress to go through it, so many are the traps for the unwary. It is singular how seldom the natives fall into the boiling water. They may be averse to speak of it; but I only heard of one instance, a poor woman, who fell in at Whakarewarewa, and was scalded to death. I was once in the Yellowstone Park, in Wyoming, when a similar accident occurred. A lady tourist slipped into a large pool of boiling water, and was rescued by one of the soldiers who are always hanging about the stations, and who jumped in after her. Both were severely scalded; and I was glad to hear subsequently that the gallant fellow had been very handsomely rewarded. A little stream of hot water flows along the side of the road for some distance, and in it a Maori boy is holding a horse for the cure of a sprained ankle—a pleasant kind of cure both for man and beast. In a little pool of boiling water there is a Maori kettle preparing for afternoon tea; and farther on, on the other side of the stream, a miniature geyser is spurting forth drops of the same fashionable fluid—the boiling water, not the tea. A wooden box or sink with open spars in the bottom, inserted in a pool or steam-hole, serves as a potato pot.

Out along the plain the road runs, passing here and there a cultivated field, but more often the original bracken or manuka scrub, until a little knot of people a short distance off the road, a few horses going loose, and the football posts, indicate the scene of the contest. The football ground, while slightly better than that surrounding, owing either to the treading or cutting down of the bracken, is still very rough, and rather resembles a level bit of moor than the trim football fields at home.

The Rugby game appears to have obtained a firm hold in New Zealand, and I think will always be preferred by the Maoris. They would have a difficulty in acquiring the restraint on the hands which is the peculiarity of the Association game, and which, of all the acquirements of civilisation, appears to be about the last to be learned by savage nations. On the game being started, I find that there are two white young men playing, and to them has been relegated the important post of full back on each side. The others are either pure Maoris or with a more or less Maori ancestry. I was somewhat surprised to see one or two of the natives playing without shoes or stockings; but a continual stripping went on throughout the game, and before the end many of them had nothing on but their knickerbockers, and, as may be imagined, were rather

difficult to hold. The game was perhaps a little rough, but fast and excellently played. It was truly wonderful to see a Maori scudding along with his bare feet on the rough ground, full of broken or cut bracken, and finishing up with a good drop at goal with his bare toes. The only ones who did not go in for stripping were the two whites, and two of the Maoris who had been in the team which had visited England.

The Jubilee Team was a scratch one, got up among old players in the district, and although their individual play was perhaps superior, the combination of the regular Club enabled them to score more points. One of the latter Club—a man conspicuous by a brilliant band of ribbon and a very black beard—in his excitement and in derision, danced about and yelled, 'Oh! the Jubilee, the Jubilee!'—if I mistake not, the burden of a song of the '87. The spectators were few, mostly natives, and all more or less dressed in European costume. A prominent exception, however, was an old Maori with hideously-tattooed face, who is known to strangers as the poet of the village. With the exception of his head-dress, his costume appeared to consist of two shawls or blankets, one worn round his loins and hanging down like a kilt; the other wrapped round his shoulders. His head-dress was a Balmoral bonnet, a relic probably of the war. Giving the usual salutation, 'Tenakoe,' he squatted down beside me, and favoured me with a running commentary in Maori on the game.

Far out on the lake, the island of Mokoia—to which the Maori girl Hinemoa, reversing the order of the old Greek legend, swam to meet her lover—is turning black in the silvery gray water, and conjures up the many romantic stories which cling to it. But football is a hungry thing, especially to the onlooker. The romantic gives way to the practical; and our next thoughts are of a special Maori supper of wild pig and kumara which our host has promised us.

FORBEARANCE.

Nay! let it pass!
'Twas but a hasty word,
Unthinking uttered as unwilling heard—
Although upon my ear it strangely jarred,
A lifelong friendship shall not thus be marred;
Nay! let it pass!

Nay! let it pass!
I will not answer so,
Lest words on words to greater difference grow;
Unguarded moments come to all—to me
Oft needs the trust of loving charity;
Then let it pass!

Then let it pass,
And not a thought remain
To pain my heart or give another's pain;
Let hearts be true, and let the friendship end
That bears not with the failings of a friend.
Yes! let it pass!

MANNER AND MANNERS.

A MAN'S Manner—like the voice of Jacob—is his own; his Manners are often assumed—like Jacob's coat of skins—to deceive, or at least to pretend to some other character than his own. More insight may be gained into a man's character by observing his manner, even than by noting his actions. For he may do a kind action without being kind, a brave one without being courageous, a charitable one without being benevolent, since Pride, Prudence, Expediency, or Vanity may have dictated them all. But his manner—the manner that clings to him in his dressing-gown and slippers with a pipe between his lips; his manner of helping his family and himself when he carves the joint; his manner at cards, when, his hand being good, he is perceptibly triumphant—and bad, he is visibly cast down and irritable; his manner, when he alters it into 'company manners' on the advent of guests. His manner is the man himself; his manners are probably founded on those of some one he admires or has admired. For seldom do men take the trouble, or have minds original or self-confident enough, to form their own manners. Whatsoever a man's manner may be, then, is of prime importance to himself; while his manners are more important socially. With a kindly, polite, affectionate manner a man may half ruin his family and yet not forfeit their regard. It is the old story: this one, with frank, amiable, hearty manners, may not only enter the field, but remove the horse from it unchallenged; while that one with scowling face, rough voice, and ill-manners—why, his neighbours naturally object to his looking over their hedge.

Though a man have talent, virtue, and good-conduct, if they are coupled with disagreeable manners, he may be respected, feared, obeyed, and—hated. He shows a want of sympathy with the pursuits, the trials, the difficulties, the temptations of those about him, perhaps, and it is wonderful how nearly allied this want of sympathy is to a desire to quarrel, and how quickly

a quarrel spreads beyond the original disputants into factions. Much greater efforts are bestowed nowadays on making young men and women learned and accomplished than on cultivating in them either sympathy in the pursuits of others, or good-temper or geniality; yet neither learning be it ever so profound, nor accomplishments be they ever so brilliant, will bring them or those about them half the happiness that kindly, sympathetic, good-natured manners will diffuse. Nay, so unfitted are many persons for family life or social intercourse, that they will turn their very advantages into means of annoyance to those with whom they live. And this for the want of training in good-manners, the which, if they possessed, they would neither be sour, pedantic, disputatious, over-accurate on the one hand, nor fussy and overwhelmingly gushing on the other.

Wilkes knew the value of good-manners when he avowed that, ugly as he was, he was only half an hour behind the handsomest man in England. Within that space of time, experience had taught him that by his manners he could make up the leeway his appearance and reputation had together lost him. That he made no idle vaunt was proved on one memorable occasion, when his untiring courtesy and insinuating address procured him not only toleration, but answering politeness from one who not only differed from him politically, but, socially, sincerely despised him. This is the more surprising, since it is certain that not only do 'all manners take a tincture from our own,' but that we read the manners of others by our conception of their characters. Thus, the very same words and phrases may give us pleasure or offence according to our estimate of the speaker. That the manners which are admirable in one place appear ridiculous in another, all who know both town and country will easily admit; because, while courtesy is everywhere alike, ceremonies differ infinitely. It is just these surface ceremonies which a well-bred man will be quick to seize and adapt himself to. Swift tells us that it is a principal point of good-

breeding to suit our behaviour to the three several degrees of men—our superiors, our equals, and our inferiors; it may be added, that as the sword of best-tempered metal is the most flexible, so the truly generous are most pliant and courteous in their behaviour to inferiors.

The chief sources of ill-manners—beside the want of sympathy with other people's pursuits, referred to above, and the *gaucherie* arising from want of early training or from shyness—are pride, ignorance, and ill-nature. If a man arrogantly considers himself the superior of his company, or of some portion of it, he is pretty sure to show that he so considers himself. Or, say, he is ignorant—not of the customs and ceremonies of what a foolish few choose to call 'society,' but ignorant of the measure of deference due to age, sex, sickness, or any other infirmity, he is pretty certain to betray this ignorance by ill-manners. If he be ill-natured, and nourishes a grudge, be sure he will find an opportunity of making the object of his dislike uncomfortably aware of his displeasure. As clever, perhaps, as he is courageous, even the subject of his attack will sometimes yield him a reluctant admiration, while he roars down all opposition, affirming that he cannot furnish his opponents with brains as well as arguments. In fact, like some preachers who will not scruple to assert 'that all right-minded and thoughtful people must agree with them,' he will assure his opponent that, if unconvinced, it is entirely his own infirmity.

But if a man be free of these three defects—pride, ignorance, and ill-nature—let him be placed wherever fortune will, there is no fear but that he will comport himself with the courtesy which is the result at once of good-nature and good-sense; and without which he will be a clown, though he had been a master of ceremonies all his days. In the presence of these two—good-sense and good-nature combined—there is ease and security that not only will our opinions be respected, but even our prejudices and prepossessions will be gently dealt with. Yet, to attain to a generous courtesy, more even than good-sense and good-nature is necessary; some self-denial must be practised, not with a view of obtaining services in return, as some cynics would have us believe, but because a handsome courtesy surely is twice blessed, breeding in return that reciprocal kindness which we conceive of as governing the behaviour of the angels themselves.

Some manners there are, which, like some colours, are not offensive in and by themselves, in their own sphere, or at a distance, but which, placed in juxtaposition with others that neither agree with nor are complementary to them, become glaringly incongruous. Thus, a broad boisterous humour—not without merit in itself, perhaps—obliterates, overpowers, by its native strength and vividness, the tenderer hues of a gentler fancy, just as a brilliant French-blue drawing-room suite, harmless and even handsome in an upholsterer's warehouse, becomes obnoxiously obtrusive in the presence of living and moving figures and colours more subdued. Yet it must be confessed that to the ordinary eye good-breeding is often invisible: like the woman who is too well dressed to attract attention.

Good-manners, no more than wit, genius, learning, or sprightliness, are welcome everywhere. There are innumerable coterie where an affectation of superior refinement, an air of doing and saying, not so much what is right and kind, but the 'correct thing,' what is fancied to be said and done by their superiors in rank or fashion—is much more impressive to the meagre worshippers of the idol caste than the beauty of courtesy itself would be. Indeed, so little do they understand it, that the extra politeness assumed sometimes to keep presumptuous folks at a distance will be put down by them to their own exceeding merits, and a cool reserve is met with a ridiculous assumption of condescension, as though to set us at our ease.

While good-nature is like bread—the staff of everyday life—manners that are superficial and exaggerated are like the paint and powder on the face of a handsome woman, not merely needless, but impairing what they are supposed foolishly to improve. The idea of their own importance is strongest in the weakest frames: they will think themselves great because they think little of their associates, valuing themselves principally on little niceties, affectations, and fantastical mannerisms, laborious frivolities. For a man to be satisfied with the approval of his coterie, even though accompanied by his own secret dissatisfaction, is the mark of a small mind; while for him to be satisfied with his own behaviour, even though it be condemned by his little circle, argues a soul of no common stamp.

BLOOD ROYAL.*

CHAPTER XVII.—IN SEARCH OF AN ANCESTOR.

DICK'S first year at the Pipe-roll was anything but a lazy one. Opulence in the shape of two hundred and fifty a year came to him with the encumbrance of plenty to do for it. He had the office routine to learn, and rolls and tallies to decipher, and endless household difficulties of his own to meet, and all the children's schooling and other arrangements to look after. It was still a struggle. But by dint of hard work and pinching, with Maud's able assistance, things came straight in the end somehow. Dick got a pupil or two in his spare time—happier men than himself, who were going up under luckier auspices to Oxford; for, though Dick put the best face upon it, still, it was a pull leaving that beloved university without a degree. However, the year wore on, as most years wear on, good, bad, or indifferent; and Mary Tudor, too, left her place at Chiddingwick rectory, and got another one, better paid, with nice people in Westminster. She was a constant Sunday visitor at the Plantagenets' rooms; and so, in vacation, was Archie Gillespie, whose unflinching devotion to his college friend struck Dick every day as something truly remarkable. Brothers are so dense. Maud smiled at him often. If he had paid a quarter the attention to any other girl that Archie paid *her*, how instantly *she* would have perceived it! But Dick, dear Dick, never seemed to suspect that Archie could come for

* Copyright 1892 in the United States of America by the Cassell Publishing Company.

anything else on earth except to talk over the affairs of the family with him. And yet, men consider women the inferior creatures!

Much of Dick's spare time, however—for, being a very busy man, of course he had often spare time on his hands, amounting frequently to as much as half an hour together—was spent in a curious yet congenial occupation—the laborious hunting-up of the Plantagenet pedigree. A certain insane desire to connect his family with the old royal House of England pursued Dick through life, and made him look upon this purely useless and ornamental object as though it were a matter of the gravest practical importance. Maud felt its gravity, too, quite as much as her brother; it was an almost inevitable result, indeed, of their peculiar up-bringing. Every man has necessarily what the French call, well, 'the defects of his qualities'—faults which are either the correlatives or the excess of his particular virtues. Now, the Plantagenets had preserved their strong sense of self-respect and many other valuable personal characteristics under trying circumstances, by dint of this self-same family pride; it was almost necessary, therefore, that when Dick found himself in a position to prove, as he thought, the goodness of his claim to represent in our day the old Plantagenet stock, he should prosecute the research after the missing links with all the innate energy of his active nature. Mary Tudor, indeed, whose practical common sense was of a different order, sometimes regretted that Dick should waste so much valuable time on so unimportant an object; to her, it seemed a pity that a man whose days were mainly spent in poring over dusty documents in the public service should devote a large part of his evenings as well to poring over other equally dusty documents for a personal and purely sentimental purpose. 'What good will it do you, Dick, even if you do find out you're the rightful heir to the throne of England?' she asked him more than once. 'Parliament won't repeal the Acts of Union with Scotland and Ireland, and get rid of the Settlement, to make you king, and Maud and Nellie princesses of the blood royal.' Dick admitted that was so; but still, her frivolity shocked him. 'It's a noble inheritance!' he said, with a touch of romance in his voice. 'Surely, Mary, you wouldn't wish me to remain insensible like a log to the proud distinction of so unique an ancestry! They were such *men*, those old Plantagenets! Look at Henry II., for example, who founded our House for most practical purposes; there was a wonderful organiser for you! And Edward I., what a statesman! so far before his age! and the Black Prince—and Edward III.—and Henry V., what strategists! It isn't merely that they were kings, mind you: I don't care about that; since I came to know what really makes a man great, I haven't attached so much importance to the mere fact of their position. But just see what workers the old Plantagenets were in themselves, and how much they did for the building-up of England—and, indeed, of all Britain, if it comes to that, for wasn't Scottish independence itself a direct result of the national opposition to Edward Plantagenet's premature policy of unification? When I think of all those things, I feel a glow of pride: I realise

to myself what a grand heritage it is to be the descendant and representative of such early giants; for there were giants in those days, and no man could then be king unless he had at least a strenuous personality—oftenest, too, unless he were also a real live statesman. Our ancestors themselves knew all that very well; and when one of our line fell short of his ancestral standard, like Edward II. and Richard II., he went soon to the wall, and made way for a stronger. It's not about them I care, nor about mere puling devotees like poor Henry III.: it's my descent from men like those great early organisers, and thinkers, and rulers, who built up the administrative and judicial system we all still live under.'

When he talked like that, Maud thought it was really beautiful! She wondered how Mary could ever be insensible to the romantic charms of such old descent! But there! Mary wasn't a Plantagenet, only a mere Welsh Tudor; and though she was a dear good girl, and as sweet as they're made, how could you expect her to enter fully into the feelings of the real old family? As for Archie Gillespie, he said to Mary more than once: 'Let Dick go his own way, Miss Tudor: it gives him pleasure. He thinks some mysterious good is going to come out of it all for him and his, if he can fill in the missing links in the Plantagenet pedigree. Of course, that's pure moonshine. Still, we must always remember it was the Plantagenet pedigree that gave our Dick his first interest in English history, and so made him what he is; and anything deserves respect which could keep Edmund Plantagenet's children from degenerating, as they would have degenerated, from their father's example, without this inspiring idea of *noblesse oblige*: an idea which has made Dick and Maud—I mean, Miss Plantagenet—hold their heads high through life in spite of their poverty. It can do Dick no harm now to pursue a little further this innocent hobby; it will give him a better insight into the byways and alleys of early English history; and if he can really establish the Plantagenet pedigree throughout, it may serve to call attention to him as a sound historical researcher. Fortunately, he knows what evidence is; and he won't go wrong, therefore, by making heedless assumptions and incredible skips and jumps, like half our genealogists.'

So Dick persevered for fully twelve months in his eager attempt, by hook and by crook, to trace his own family up to Lionel of Clarence, upon whom Mr Plantagenet himself had early fixed—at pure haphazard—as the special transmitter of the Plantagenet blood to the later branches of the House, himself included. The longer Dick worked at it, too, the more confident he became of ultimate success. Step by step turned out right. He had brought the thing down, he told Mary, to a moral certainty; only one link now remained to complete the entire pedigree. That's always the way, it may be mentioned parenthetically, with your doubtful genealogy; there's only one link missing—but unfortunately, that's the link on proof of which the whole chain is dependent. And very naturally, too: for this is how the thing works out. You track your own genealogy, let us say, back to a person named Plantagenet, who

lived some time in the sixteenth century, and with whom you are really and undoubtedly connected by an unbroken and traceable ancestral series. Then you track the family tree of Lionel of Clarence forward, in the opposite direction, to a real and historical Plantagenet who 'flourished,' as the books say, near the end of the fifteenth century. After that you say: 'If my ancestor, the sixteenth-century Plantagenet, turns out to be the son of Lionel's descendant in the fifteenth century—as is extremely probable—why, then, it's all made out—I'm descended direct from Lionel of Clarence; and in any case, don't you see, there's only one link missing!' Wise genealogists usually abstain on purpose from the attempt to hunt up that fatal missing link; they know right well that the safest plan is to assume identity, while efforts at proving it are frequently disastrous. But Dick was still young, and not perhaps overwise; so once he had brought down the matter to a question of a solitary missing link, he couldn't rest night or day till he had finally settled it.

One evening, he returned home from the office to Maud, overflowing with a new and most important discovery. 'Well, the thing's all but proved, at last,' he cried in a triumphant voice, as he kissed her warmly: 'at least, that is to say, I've found a valuable clue that will decide the matter finally one way or the other. I've discovered a conveyance of the sixteenth century, dated 1533—here's a verbatim copy of it—which describes Thomas Plantagenet, our great-great-grandfather's grandfather, as being really the son of Giles Plantagenet, the missing-link man, who is said in it to have owned a house—and this, you will see, is the new and important point—at Framlingham, in Suffolk. He seems to have been some sort of a petty tradesman. Where Giles first came from, we had till now no means of knowing. But after this clue, all we've got to do next is just to hunt up the local records at Framlingham and find out that this Giles Plantagenet, already known to us, was the son of that Geoffrey Plantagenet of Richmond, in Yorkshire, whom I showed long ago to have been the last traceable descendant of Lionel of Clarence, and concerning whom Lysons says, without a shadow of authority, *decessit sine prole*, he died without issue.'

'It seems rather a leap, though, for those days, doesn't it,' Mary put in timidly, for she dreaded the effect of a disappointment upon Dick's nervous nature, 'from Richmond to Framlingham? I thought people rarely went then much beyond their own county.'

'That was true, no doubt, for the middle and lower classes,' Dick answered with a faint tinge of Plantagenet pride in his voice; 'but hardly even then, I should say, for people of such distinction as Geoffrey Plantagenet. Gentlemen of high rank, and members of the peerage and the royal family, had manors, you know, in many different counties, and moved on from one to another from time to time, or left them about by will to various sons and daughters. We mustn't judge such great folk by the common analogies of ordinary people.'

'Still, Dick,' Maud interposed, a little startled herself, 'even if Mary's objection doesn't hold good, it *does* seem a little odd, doesn't it, that Giles Plantagenet should be a petty tradesman

at Framlingham, if he was really the son of such a man as Geoffrey, whom we know to have been a county gentleman of distinction in Yorkshire?'

'I don't think so at all,' Dick answered with a little surprise. 'In those days, you see, Maud, when there was no middle class, people went up and down easily. Attainder was so common, and loss of estates such an every-day occurrence, that the vicissitudes of families must often have been much more rapid and startling than nowadays. However, it's no use arguing beforehand about a plain question of fact. It was so, or it wasn't. I shall soon find out which. The records are almost sure to be preserved at Framlingham, because it was the seat of the Howards; and I shall go down there next Bank Holiday and settle the question. After that, I'll publish the result of my search; and then nobody will ever be able to say in future we made a false pretence of being real royal Plantagenets.'

He spoke so confidently that he really frightened poor Mary. She couldn't help thinking what a terrible shock it would be to him if by any chance he should turn out after all to be mistaken, and if Giles Plantagenet should prove to be other than the son of Geoffrey.

So real did this danger appear to her, indeed, that as Bank Holiday approached, and Dick talked more and more certainly of his visit to Framlingham, she spoke quite seriously on the matter to Maud. 'Do you know, dear,' she said, taking her friend's hand, 'if I could have got away for the day, I'd go right down to Framlingham with him, though it seems to me a dreadful waste of money for so useless a purpose.'—At that, Maud's eyes flashed; poor dear Mary! she never would understand the feelings of a Plantagenet. 'What I feel is this,' Mary went on, all unheeding. 'I'm obliged to stop at home that day with the children; but I wish I could go: for if by any chance it should happen to turn out that Dick was mistaken after all, and Giles Plantagenet *wasn't* the son of Geoffrey, I'm afraid the shock would quite unman him for the moment, and I hardly know what he might be tempted to do in the first keen sense of intense disappointment.'

Maud's lip curled slightly. Nursery governess as she was, the old dancing-master's daughter had all the pride of a duchess—and why not, indeed, since she was a princess of the blood royal? 'Oh, that wouldn't make any difference, dear,' she answered confidently. 'We *are* Plantagenets, don't you see? and if we don't happen to be descended from that particular man Geoffrey, we must be descended through some other member of the Plantagenet family. My poor father was sure of it; and it's always been known in Yorkshire for many generations.'

However, Mary was so urgent, and so afraid of the consequences of a sudden disappointment—for she knew Dick's nature, and loved him dearly—that at last Maud consented to accompany her brother on his projected trip, and guard him against the results of an impossible failure.

Bank Holiday came, in due time—a lovely summer day; and Dick and Maud went down together by cheap train to Framlingham. The banks by the side of the rail were thick with flowers. They reached there early in the day,

and Dick called upon the rector at once, sending in his card with name and address at the Pipe-rolls. As he expected, that introduction amply sufficed him. Nor was he disappointed about the preservation of the Framlingham records. The church possessed a singularly perfect collection of baptismal and marriage entries from the beginning of the fifteenth century onward. In less than half an hour, Dick was thick in their midst, turning over the dusty leaves of those worn old books with all the eagerness and enthusiasm of a born genealogist.

Maud sat with him for a while in the gloom of that dimly-lighted chancel; but after half an hour or more of hunting page by page, her patience began to give out, and she proposed to stroll away towards the castle ruins, and return a little later to see how Dick progressed with his quest after ancestors. Dick acquiesced readily enough, and Maud went off by herself down the leafy lane that leads straight to the castle.

For some time she amused herself in the deep hollow of the moat, and walked round the great circuit of the frowning rampart. It was a splendid ruin, she thought, the finest she had seen. Then she mounted the broken wall, and looked out upon the wide plain, and admired the beautiful view of the church and village. A flag floated from the tower, as if in honour of Dick's presence. At last, as lunch-time approached, she lounged back lazily to Dick. They had brought their own bread and cheese and a few sandwiches with them, and she had picked out mentally a cool spot under the spreading chestnuts which seemed to her the very place in which to make their impromptu picnic. So she opened the church door in very good spirits, for the fresh country air had exhilarated her like champagne after so long a spell of that dusty London; and she went straight to the chancel where she had left poor Dick an hour before among his tattered registers.

As she drew near, a sudden terror rushed over her unexpectedly. What on earth could this mean? Dick was gazing at the books with an ashen-white face, and with eyes that fairly started out of their sockets for staring. He raised his head and looked at her. He couldn't speak for horror. With one hand he beckoned his sister mysteriously to his side; then he moistened his lips at last and pointed with one accusing finger to the entries. 'Look there, Maud,' he faltered with a painful effort; and Maud looked where he bid her.

It was a mongrel entry, half Latin, half English: 'Die 14 Junii, anno 1498, Giles, the son of Richard Plantagenet, cobbler, and of Joan, uxoris eius, huius parochiæ.'

Maud glanced at the words herself with a certain vague sense of terror. 'But perhaps,' she cried, 'after all, this Richard Plantagenet himself was of royal ancestry.'

Dick shook his head with a terrible, a despondent shake. He knew when he was beaten. 'Oh no,' he answered aloud, though he could hardly frame the words. 'I know what I say. I've found out all about this Richard Plantagenet, Maud. He was the ancestor of the other people—the false Plantagenets, don't you know, the Sheffield family who left the money. He never was a true Plantagenet in any way at all.

It was only a nickname. He acted the parts of the Plantagenet kings, one after the other, in a masque or pageant, and was known from that time by pure fun as Richard Plantagenet. But that was in London; and we didn't know till now he was ever settled at Framlingham.'

'And *must* we be descended from him, Dick?' She asked it piteously, pleadingly.

'Oh, Maud, yes, we must. There's no other way out of it. I've worked up the whole thing so thoroughly now—to my own destruction. I know all about him. His real name was Muggins; and that's *our* real name too; and this book—this horrid book gives all the facts necessary to prove our descent from him; and the Sheffield people's too, who are really our cousins.'

He said it with utter despondency. The truth was wrenched out of him. Maud clasped her white hands and looked hard at poor Dick. This disillusion was just as terrible for her as for him. 'You're quite, quite sure?' she murmured once more in a voice of pure agony.

'Yes, quite, quite sure,' Dick answered with a tremor, but with manful persistence. 'There can't be a doubt of it. I knew everything about this wretched creature before, except that he was a Framlingham man: and there are entries here in the book—you can see them for yourself—that leave no shadow of doubt anywhere about the fellow's identity.—Maud, Maud, it's been all a foolish, foolish dream. We are not—we never were—real royal Plantagenets!'

Maud looked down at the ground and burst into hot tears. 'Then I'll never marry Archie,' she cried. 'Never, never, never! I'll never ask him to take a mere nobody from Chiddingwick. My pride wouldn't allow it—my pride would stand in the way: for I'm as proud as before, Dick, though I'm *not* a Plantagenet!'

THE STAGE 'DRESSER' OF LAST CENTURY.

THE poverty of theatrical 'properties' and scenery in the early part of last century is ridiculed in the *Tatler* of 16th July 1709, which professes to give an inventory of the 'movables of Christopher Rich, Esq.,' who is described as 'breaking up housekeeping, and has many curious pieces of furniture to dispose of, which may be seen between the hours of six and ten in the evening'—the theatrical hours of the period. Among them we find—'spirits of right Nantz brandy, for lambent flames and apparitions; one shower of snow in the whitest French paper; a sea, consisting of a dozen large waves, the tenth bigger than ordinary and a little damaged; a new moon something decayed; an imperial mantle made for Cyrus the Great, and worn by Julius Cæsar, Bajazet, King Harry the Eighth, and Signor Valentini; a serpent to sting Cleopatra; the complexion of a murderer in a bandbox, consisting of a large piece of burnt cork and a coal-black peruke; a suit of clothes for a ghost, viz., a bloody shirt, a doublet curiously pinked, and a coat with three great eyelet holes upon the breast.'

To John Philip Kemble belongs the credit of being the first theatrical manager who laid the

foundation of that improvement in scenery and scenic effect which we have seen brought to such perfection in our own day. Boaden the dramatist, one of Kemble's biographers, tells us there were persons still living in his time who could remember the miserable 'pairs of flats which used to clap together on even the stage trodden by Mr Garrick; architecture without selection or propriety; a hall, a castle, or a chamber, or a cut wood of which all the verdure seemed to have been washed away.' This brings him to the improvements in costume, scenery, and scenic effect wrought by John Philip, on the subject of which Boaden, who is not always as clear as he might be, concludes his observations with a very strange remark: 'Unquestionably, all the youth, all the uniformity, all the splendour, and the costume of the stage came in, but did not die with Mr Kemble.' This was written in 1825. Boaden's meaning appears to be that, great as were the improvements introduced by Kemble, they were, after all, the mere commencement of a new era. We who live in 1892 and have seen the perfection to which stage costume, scenery, and machinery have been brought during the last quarter of a century, can unhesitatingly endorse the truth of that opinion.

It was not until Kemble's time that attention began to be given to the correct costume of theatrical characters. Our great-great-grandfathers did not trouble themselves to inquire whether David Garrick was dressed in accordance with the times in which the characters he represented were supposed to live, or in harmony with their probable surroundings: all they went to see and hear was David Garrick. This should be borne in mind when considering the ability of a man like Garrick; for the power which, in spite of the disadvantages of wretched scenery, 'properties,' and incorrect costume, could rivet the attention, must have been of necessity very great. The 'dressing' of Shakespearean characters in the eighteenth century would make us laugh in these days. Garrick in the character of Macbeth was accustomed to wear a court suit of scarlet and gold lace, with—in the later scenes of the tragedy—'a wig as large as any now worn'—I am here quoting Lee Lewis—'by the gravest of our Barons of the Exchequer.' This was the costume adopted and followed by other Macbeths of the time. A picture by Dawes represents Garrick in the fighting scenes of the play wearing a sort of Spanish dress, slashed trunks, a breast-plate, and—Heaven save the mark!—a high-crowned hat. To dress Macbeth after this fashion would be at least as absurd as if we were to put a pair of top-boots on the sturdy legs, and a 'stove-pipe' hat on the grizzled locks of Oliver the Protector.

It is not improbable that Garrick himself saw the absurdity of this method of 'dressing' a semi-barbaric warrior, and his reason for continuing to do so has been given by more than one authority. A friend is said to have remonstrated with him on the absurdity of the costume, and suggested the almost equally incongruous alternative of a Highland dress. 'It is only thirty years ago,' said David, 'that the Pretender was in England. Party spirit runs so high that if I were to put on tartan I should be hissed off the stage, and perhaps the house would be pulled

down.' To those who know anything of the strong party feeling of the period and the rough-and-ready audiences of the last century, this reported answer seems to carry on the face of it the stamp of truth.

It is noteworthy, however, that when Kemble played Macbeth at Edinburgh, on the occasion of his farewell benefit, he wore a Highland dress. Sir Walter Scott tells us: 'We divested his bonnet of sundry huge bunches of black feathers which made it look like an undertaker's cushion; in other words, the classical John Philip had 'dressed' the hero of Shakespeare's tragedy in the well-known habiliments of the Highlander of the snuff-shop. Sir Walter knew this perfectly well; and by his advice and by his hands the feathers were replaced 'with a single broad feather of an eagle sloping across' the actor's 'noble brow. He told us afterwards,' says the novelist, 'that the change to him was worth three distinct rounds of applause as he came forward in this improved and *more genuine headgear*.' The italics are ours. Even Sir Walter does not seem to have been struck with the absurdity of an 'improvement' which was merely a mistake in another direction. As a matter of fact, Macbeth was never dressed to the taste of antiquarian critics until the revival of the tragedy by Mr Phelps at Sadler's Wells in 1847, and by Mr Charles Kean at the Princess's some few years later. The date of Macbeth's death is fixed at the year 1057, and the costumes selected on these occasions were those of the eleventh century.

Grotesque as was his 'dressing' of Macbeth, the costume in which David Garrick and his successors were accustomed to array Othello was certainly not less remarkable. Before Kemble's time, Othello usually presented himself in 'a stiff skirted coat, white breeches, waistcoat, white full-bottomed wig, and three-cornered cocked-hat.' If to this remarkable costume, which the reader should perhaps be told was the uniform of a British general officer of the period, you add Othello's blackened face, you have a result which in these days could only be realised by a Moore and Burgess Minstrel. Occasionally, however, Othello was habited in a semi-eastern costume—a Moorish jacket and trousers—which, if not so absolutely preposterous as the other, must strike any one only slightly acquainted with European or Venetian history as ridiculous and absurd. 'The general of an Italian state,' says James Boaden, with something approaching to historical accuracy, 'would wear its uniform; he would never be indulged with the privilege of strutting about like "a malignant and a turban'd Turk" at the head of a Christian army.' Kemble was the first to knock over these ridiculous and absurd stage notions. 'He searched,' says Donaldson, 'the surroundings and paintings of former ages, and had the historical drama dressed in the proper costume of its period.' The statement is a little too wide and comprehensive to be strictly accurate, a fact which in no way detracts from the merit due to John Philip as an earnest and intelligent stage reformer.

The stage is made up of contrast—tragedy, comedy; melodrama and burlesque: to change to a lighter subject is strictly within the area of my theme, because it serves to illustrate in

another direction some of the changes which have taken place in theatrical costume. Joseph Grimaldi was the inventor of the present clown's dress. Before Joey's time, the clown—in costume, but in nothing else—was a sort of English Pierrot, an impossible combination, and a necessary failure. Joey seems to have recognised the fact that English low humour was unsuited to a Frenchman's dress, and that between the Pierrot—a 'personnage de carnaval'—and an English clown there was, and could be, very little in common. He broke up, therefore, the blank white of Pierrot's dress with the variegated spots, stars, and patches to which we are now accustomed. But Grimaldi in his own particular line, narrow as it was, was a man of inventive resource—to some extent a genius. Nearly all the so-called 'comic business' is of his invention. The Harlequin—probably without knowing it—continued to dress himself à la Watteau until the year one of the present century, when James Byrne, father of the late Oscar Byrne, introduced a change. In the pantomime of 'Harlequin Amulet, or the Magic of Mona,' produced at Drury Lane, he appeared as Harlequin, in a tightly-fitting white silk shape, into which the well-known coloured silk patches were woven, the whole being profusely covered with spangles, and presenting an unusually sparkling appearance. This is the costume worn by all the Harlequins of the present day.

THE IRONY OF FATE.

CHAPTER III.—MAJOR BOWYER.

It was the day following her father's death. Arabella and her aunt were sitting in the drawing-room, waiting the arrival of her uncle. Presently the hall bell rang; there was a bustle on the stairs, and then the door was flung open and the footman announced 'Major Bowyer!'

Most people thought the Major a genial, kind-hearted man. He was of commanding presence, tall, and remarkably handsome; had a fine figure, fine features, and a florid complexion. These, with his debonair manner and a soft melodious voice, made him a general favourite in society, especially with the fair sex. He entered the room with a cheerful salutation to both his sister-in-law and niece, and though he put on a pleasant smile, he in reality was not in the best of humours. On his way down in the train the death of Mr Alsworth had been a topic of conversation; and his first impression was that, as he knew that the deceased had appointed him sole executor and trustee, his position would not be an unpleasant one. Arabella was a handsome girl, and to have such a fine young creature under his control for the next two years at least, and also to have the management of her property, was not at all disagreeable. But presently something was said about large losses and consequent embarrassment, and then things assumed an entirely different aspect. The idea of having his niece dependent on him, instead of his having the command of her thousands, was a state of things he had never contemplated; and consequently, when he arrived at Netley Lodge, his temper was somewhat ruffled. But he was too

politic a man to let either Arabella or Miss Mortimer know his thoughts; so he smiled graciously on the former, and kissed her affectionately; and then approaching the latter, he said: 'Well, Betsy, how do you do?' and stretching out his hand indifferently, he continued: 'Glad to see you looking so well.'

Miss Mortimer and the Major had never been on particularly friendly terms; but, in her present position, she was very glad that Arabella should have some one to help and advise her more competent than herself; so she replied: 'Thank you, Robert. Thank you very much for coming. In this melancholy business, you will be a great help to my poor Bella.'

'Certainly, certainly! I shall do all I can,' he replied airily. 'But what is this I heard in the train about losses and embarrassment?'

Arabella shook her head. 'We are almost as much in the dark as you are, my dear uncle,' she said. 'All we know for certain is that papa's stockbroker has absconded, taking with him twenty-seven thousand pounds of his money.'

'What! That rascal Sinclair?'

'Yes.'

'But surely the loss of twenty-seven thousand pounds would not mean ruin. Can't you tell me anything more?'

'No; I have written to Mr Ainsley—that's papa's lawyer—and informed him of the sad event; and he replied that, if I would let him know the day appointed for the funeral, he would come down and bring the will and the papers with him. I don't know much about it; but I thought from the tone of the letter that things might turn out better than we expected.'

'I hope and trust, for your sake, my dear, that they may.—But now, what about dinner?'

'We dine at six,' she replied; 'and'—looking at her watch—'it is now half-past five.'

'Well, then, I'll go and dress. I suppose they have taken my luggage up.' And, to Miss Mortimer's inexpressible relief, he rose and left the room, accompanied by Arabella, who volunteered to show him to his apartments.

'What a wretched, cold-hearted creature!' murmured the soft-hearted lady. 'Not a word of sympathy or comfort to the poor child, nothing but money.'

The dinner was over; the ladies had retired, and Major Bowyer was sitting by the fire sipping some of Mr Alsworth's choicest Burgundy, and he felt quite comfortable and quite at his ease. The ill-humour with which he had entered the house, the natural result of bad news and a journey on a winter's day, had yielded to the agreeable influence of the house. He was, too, greatly pleased with his niece. Even if the state of affairs turned out as everybody seemed to imagine they would, he was beginning to think that to have so fine and graceful a girl as a member of his establishment would be no such unpleasant thing, and certainly would, as an attraction, be worth the expense. So he sat on, smoking and thinking till the Burgundy was finished, and at an early hour went to bed.

The days passed slowly. From the time Major Bowyer entered the house, he, as it were, took command of everything, much to Arabella's satisfaction. Miss Mortimer, however, was not so

well pleased. She knew more of her brother-in-law's character than her niece, and had a vivid recollection of what her dead sister had suffered under his despotic rule.

At last the day of the funeral arrived. Arabella had taken a last look at the placid face of her dear dead father; the coffin had been screwed down; and now the sombre procession was slowly wending its way down the drive. The poor orphan was sitting bathed in tears. She had seen the last of him she had loved so dearly, and who had loved her with an equal if not a stronger passion, and she felt sad and desolate. Presently other thoughts crept into her mind and occupied her brain. She was looking back into the past and musing on the future. Was the happy life she had led to be a thing of the past? Had the sunshine of her life faded and passed away for ever? She sat for some time silent and discouraged, how long she never knew, and then she and Miss Mortimer were summoned to the library to hear the will read. Her uncle met her at the door and conducted her to a seat, and the reading commenced.

CHAPTER IV.—SPREADING THE NEWS.

In their own estimation, the Misses Scudamore were not, as some of the inhabitants of Nunsford imagined, selfish, stingy, and narrow-minded; on the contrary, taken at their own appraisement, they were just the reverse, being large-hearted, benevolent, and charitable. It was true that if they distributed tickets for bread and coals, these indispensable commodities were invariably paid for with other people's money. Again, when they had a piece of news, they did not keep it to themselves, but took the earliest opportunity of disseminating it as broadly as possible. There was no newspaper published in Nunsford, and consequently, if the Misses Scudamore had not taken upon themselves the office of 'news-vendor,' nobody would have known anything about anybody's business but their own. If, therefore, the Misses Scudamore looked upon themselves as benefactors to society generally, it is not much to be wondered at.

'There now, Prudence!' said Miss Scudamore; 'that's no idle delusion, that's an undoubted fact.'

'Of course it is,' replied Prudence; 'and I could take my oath to it before a whole bench of magistrates.'

'We'll call in at Mrs Montessor's as we go along and tell her the news. I should think we shall be the first, as the workmen had only just finished when we passed,' said the elder lady.

About ten minutes afterwards they were ushered into Mrs Montessor's morning-room, where they found Miss Puddicombe; and after the usual salutations, Miss Scudamore commenced: 'You've not seen it, of course—it's only just been put up.'

'Seen what?' asked Mrs Montessor.

'The board.'

'What board?'

'The one I told you about—don't you remember?'

'No,' she replied, rather techily.

'Well, then, I'll tell you. It's on the lawn

at Netley Lodge, and it informs the public that this eligible mansion is to be let.'

'Indeed! But I'm not surprised,' said Mrs Montessor. 'After what the poor old man said to me, that is what might have been expected.'

'What did he say?' asked Miss Prudence anxiously.

'He said the state of things was appalling, that men who yesterday thought themselves rich, see ruin and bankruptcy staring them in the face. Meaning, of course, that he was one of them.'

'Ruin and bankruptcy!' cried Miss Scudamore. 'I had no idea it was so bad as that. No wonder the funeral was such a shabby one—no mutes, no feathers, no anything!'

'Ah! I'm really sorry!' sighed Miss Puddicombe; 'they were such nice people, especially Arabella.'

'Do you really think so?' sneered Mrs Montessor; 'I don't. I always thought she was a horrid stuck-up thing, and that the talk about the number of her admirers was all bosh.'

'Talking about admirers,' put in Miss Puddicombe, 'have you heard that Mrs Wallis's son is coming home invalided? They say he went up a river in Africa to release some slaves. He led the party, and behaved most gallantly; and it is expected that he will get his promotion.'

At that moment there came a loud knock at the door, and a moment afterwards Miss Nugent entered, with a newspaper in her hand. 'It's abominable! I never was so deceived in my life!' she exclaimed, as soon as she had shaken hands with Mrs Montessor and Miss Puddicombe.

'What is the matter?' asked Miss Scudamore.

'It's that Bella Alsworth. It's a trick. Read this!' and placing her finger on a paragraph, she handed the paper to Miss Puddicombe.

The kind old lady drew her spectacles from her pocket and wiped them deliberately, adjusted them carefully, spread out the newspaper, and read as follows: 'THE WILL OF MR ALSWORTH OF NUNSFORD.—The will (dated May 9th, 1857) of GEORGE BEDDINGTON ALSWORTH, who died Dec. 17th, was proved at Doctors' Commons on Jan. 23d, by Robert Alexander Bowyer, the sole executor and trustee; and the value of the personal estate was sworn to be under £128,000, the bulk of which is left to his daughter, together with Netley Lodge and all his other house and landed property.'

'Why, then,' cried Miss Scudamore, 'she is, after all, an heiress!'

'Dear, dear,' sighed Miss Puddicombe, 'what a good job!'

'Good job!' blurted Mrs Montessor; 'I think it's scandalous!'

CHAPTER V.—A NEW PHASE OF LIFE.

Arabella was sitting alone; her cheeks were flushed, and a beam of inexpressible happiness, such as she had not felt for many a day, lighted her beautiful eyes. He was coming home, was already in England, and she should see him, should be clasped in his arms and pressed to his bosom. There could be no opposition to their marriage now; and her thoughts were full of

sweet visions, the chief figure in which was her sailor lover. So intensely was she engaged with her own thoughts, that she did not hear the footman announce 'Lieutenant Wallis.'

Frank advanced, unheard, through the double drawing-room, and was almost close to her before she saw him. Then, with a joyous cry, she sprang towards him, and was clasped in his arms, and her lips were smothered with kisses.

'Oh, Frank, where did you come from? I think you must have dropped through the ceiling.'

'No, dear; I came in by the door, in the usual orthodox way. But you were so lost in thought you did not hear James announce me.'

'I was thinking of you, dear,' she said shyly, as she nestled close to his side; 'but I did not imagine you had arrived. What train did you come by?'

'I arrived last night by the last train.'

'I'm so glad you are come. We are going away in about a fortnight.'

'Going away! What for?' he asked.

'Oh, it's a whim of my uncle's. He says there is no need to keep up both establishments, and so I am to live with him till I am married. So we are going to let this and go to his place in Devonshire.'

'Does he know of our engagement?'

'No; but now that you are here to help me, I shall tell him at once.'

'Will he make any objection?'

'I don't know. Why should he?'

'Trustees and guardians are sometimes awkward people to deal with. What sort of a man is he?'

'Oh, he seems a kind-hearted sort of man, and, with the exception of letting the house, allows me to do pretty much as I like.'

For a time they sat in silence, a silence both sweet and eloquent, interrupted at times by words of love and tenderness. The picture, as they thus sat, now and again conversing in low soft tones, was a pleasant one. Frank Wallis was a handsome, manly fellow, tall, and stout withal; and, if the calm, resolute eye meant anything, had the courage and daring of a lion. And Arabella, she had never looked more radiantly beautiful. The time they had been separated had developed, in a womanly way, the graces Frank had seen opening in the girl. The liquid softness of her dark-blue eyes, with their long silken lashes, was the same; but the figure, always graceful, had grown more so; the expression of the beautiful mouth had become more firm.

This happy meeting was interrupted by the appearance of Miss Mortimer, from whom Frank received a most cordial welcome.

'And what are they going to do with *you*, my dear lady?' he asked.

'Not anything. What I shall do with myself I've not decided, except that I shall not live with Major Bowyer,' she said rather curtly.

'He is no favourite of yours, I presume, then?' said Frank.

'No; he's a tyrant; and I shall never forgive his conduct to my poor sister.'

'Tyrant! Oh, aunt! cried Arabella, 'surely that is rather a harsh judgment. I've seen nothing tyrannical about him.'

'Not yet, my dear; but if you attempt to thwart him, well, then, you'll see!'

'Do you think he will be kind to my dear Bella?' Frank added.

'Yes, certainly, all the while she does as he tells her.'

'Don't worry about me, dear,' she said; 'I'm not afraid of him; besides, he may have improved with age, like old port—grown mellow, you know.'

'Well, my child, we shall see,' she replied; and that ended the conversation, and Frank took his leave.

That same evening, the moment Major Bowyer entered the house, Arabella pounced upon him, crying exultantly: 'Frank has arrived, and he has been to see me!'

'And who is Frank, my dear?' he asked coldly.

'Why, Mr Wallis! Don't you know; don't you understand?'

'No; that I do not. I have not the pleasure of knowing the gentleman.'

'How stupid you are! Don't you know he's my sweetheart—the man I am going to marry!'

The Major gave a start. 'The man you are going to marry!' he exclaimed. 'What nonsense is this?'

'It's not nonsense, uncle,' she replied in an offended tone. 'I've been engaged more than twelve months.'

'And pray, who and what is this Mr Wallis?'

'He's a Lieutenant in the navy.'

'A Lieutenant in the navy!' he exclaimed with a sneer. 'My dear child, I cannot think of allowing you to throw away yourself on a man in such a position.'

'But I'm engaged, and I love him!'

'Then the engagement must be broken off!'

'No, indeed; that it never shall!'

'Yes, it must! I shall do it myself, if you do not.'

'You can't!' she flashed. 'Nobody can put an end to it but myself; and as to your speaking to Frank, it's useless; he would not listen to you.'

'Well, well,' he said in a conciliatory tone; 'we will talk about this another time.'

'I'm afraid I shall have some trouble with this girl,' he mused, as he went up-stairs to his room. 'A Lieutenant in the navy!' he exclaimed mockingly; 'and she will have an income of more than ten thousand a year! No, no; it is Lady Cransford you will have to be, unless I am much mistaken, Miss Arabella. You will find me a very different person to deal with than your good-natured old father. Still, it's a most unexpected and unfortunate *contretemps*. I must get her away from this place as soon as I can.'

When the Major was gone, Arabella sat down to think. She felt there was some trouble in store for her. She did not like her uncle's tone and manner. It was quite evident that he was not favourable to such an alliance as she contemplated. He had spoken contemptuously of Frank as a Lieutenant in the navy. But then a Lieutenant might become a Captain, and a Captain might become an Admiral. She was quite sure that her Frank ought to be an Admiral now, if he had what he deserved. But why did Major Bowyer sneer at a Lieutenant in the navy? He

was a Major now; but he must have been a Lieutenant once, and the navy was as good as the army any day—at least in her estimation.

'Throw herself away on a man in such a position!' That was what he said. What did he expect her to do? Marry a lord? Well, she did not know much about lords; and as to being a Lady, she did not care a fig for it. No, no; Frank was a dear good fellow, and come what might, she would never marry any one but him.

THE IRISH INTERMEDIATE EDUCATION BOARD.

READERS of Irish newspapers for the past two or three months will have had their attention attracted by lists of exhibition-winners, prize-winners, classifications of successful schools, and articles generally, under the above heading. As the name does not address itself much to the intelligence of English and Scottish readers, a short article in explanation may be useful.

Some twelve or thirteen years ago the attention of Parliament was drawn by educationists to the defective condition of Irish middle-class education. Primary schools were scattered abundantly over the land, and of excellent quality, thanks to the highly-endowed Board of National Education; university education was amply provided for, too, in the Dublin University, the Catholic University, and the Queen's Colleges of Belfast, Cork, and Galway. But the education of the middle classes, which should act as a feeder for the universities, was almost non-existent. True, there were some grammar-schools, known as the Erasmus Smith's foundations, scattered over the land, but they were very few and widely apart. Moreover, they were mainly Protestant, and youths who were Roman Catholic did not attend them. Such a state of things could not be permitted to continue; and able educationists, who were consulted by the Government, devised the system known as the Intermediate Education.

The Board consists of some six or seven gentlemen of high standing, representing the various denominations. A sum of one million pounds sterling, taken from the disendowed Church of Ireland, was handed over to them, the annual interest of which was to be used for the necessary disbursements. Each year an examination, commencing generally about the 14th of June, is held at one hundred and twenty 'centres' throughout the country. These centres are, in the main, the schools which have sprung into existence since the Intermediate Education Act was passed. At these the candidates for examination attend. These latter are divided into four classes—or 'grades,' as they are more generally called. They consist of Preparatory Grade, youths from twelve to fourteen years of age; Junior Grade, from fourteen to sixteen; Middle Grade, from sixteen to seventeen; and Senior Grade, from seventeen to eighteen. The subjects of examination comprise the full curriculum of a high-class school—Greek, Latin, English Grammar, Composition, English literature, German, French, Italian, Celtic; Euclid, Arithmetic, Algebra, &c.

When the examination is due, 'centre superintendents'—generally selected from the Professors in the various schools—are despatched to the various centres, each entrusted with a box of answer-books—manuscript books of a certain form on which the candidates write their answers—and with a case containing the precious question-papers. To prevent any possible unfairness, the envelopes containing the questions for each day are sealed with the public seal of the Board, which must in nowise be broken; and the envelope can only be opened by cutting along a black line drawn immediately above the seal, which cutting, by the way, must be done in presence of the assembled class, and witnessed by the signatures of one boy from each grade. The periods of examination are from ten to one o'clock and again from three to six. At the termination of each period the student encloses his answer-book in an envelope, seals it, and hands it to the superintendent. It is the duty of this officer each evening to transmit the answer-books to the head office, Hume Street, Dublin.

The examination over and ended, the answer-books are despatched from Hume Street to the different examiners, who go through them and make a tabulated return of the results. This, which generally takes a month, is a period of breathless anxiety and expectancy throughout the country. Students await the record of their merit; Principals, the success or failure of their schools. At last the printed return appears. The names are printed in alphabetical order, and the quantity of marks scored in each subject by each pupil set after his name and totalled.

Now come the innings of students and schools. The first two hundred boys—or thereabouts—in the Junior Grade receive each an exhibition of fifteen pounds per annum, tenable for three years; the first fifty of the Middle Grade receive each an exhibition, tenable for two years, of twenty-five pounds per annum; and the first twenty or so of the Senior Grade receive each an exhibition of forty pounds, tenable for one year. All very substantial recognitions of industry and talent! Those who score next under the exhibitors receive prizes in books to the amount of three and two pounds. The number of these recipients exceeds very considerably that of the former. For those who come after, virtue must be its own reward—they get nothing. In addition to these rewards, special prizes of gold and silver medals, and of sums of ten pounds, are given for distinguished proficiency in particular subjects.

So far for the pupils; now for the schools. For every pupil who has made one hundred days' attendance from the previous 1st November, Results Fees are paid to the Principals of the schools so attended, at the following scale: Junior Grade, two shillings per hundred pass-marks; Middle Grade, two shillings and sixpence; Senior Grade, three shillings. Under this arrangement the school can obtain a maximum grant for each boy in the Junior Grade of five pounds ten shillings; in the Middle Grade, of six pounds ten shillings; and in the Senior Grade, of eight pounds ten shillings.

It will be seen, therefore, that a very considerable stimulus has been added to the energy and industry of both teachers and pupils by the

institution of the Intermediate Education Board. In a poor country like Ireland a sum of forty-five pounds for a boy of, say, fifteen years of age is no inconsiderable prize, and offers a very direct incentive to hard work and earnest study. In like manner, the sums accruing to the schools supply a strong motive-power for assiduous and excellent teaching. Before the Board was established, education in this class of schools—where they at all existed—was given and acquired in a very heedless and perfunctory manner. Now they are brought forth into the full glare of publicity; their merits and defects are noted each year; and it behoves the heads of schools to put their best effort foremost; otherwise, ruin is pretty certain to overtake them. The students will naturally flock to the most successful schools; parents will send their children there; it is the only test open to them of merit and efficiency.

It would exceed the limits of our paper to detail the extraordinary development in education in the rural districts of Ireland which has attended the establishment of this Board. There are some, however, who do not regard this as an unmingled good. They assert that boys whose minds have been elevated by this course of study will return with reluctance—for not all can hope to enter a university course—to the hard work of the farm and the menial duties of their small shops. There may be, and probably is, some truth in this. But, after all, as in the absence of trade and manufactures there is no possibility of their acquiring a knowledge of the one or the other, Irish youths must in the battle of life abroad depend solely on their mental skill and ability; and for this the Intermediate Education system amply fits them. Of good and evil, therefore, the preponderance of weight lies largely with the former.

A LUCKY CATCH.

WHEN Mrs Spellert left Tripley Hall, on the death of old Squire Hervey—where she had been housekeeper some years before the following events took place—she retired to a small ivy-covered cottage at the end of the little village of Tripley, nearest to the Hall, which cottage belonged to the Squire, as did, in fact, all the village. As she was allowed to live rent free, the Squire also gave permission to Mrs Spellert to eke out her income by taking in as lodgers any respectable persons who came into the neighbourhood for fishing and the like. At the present time she had one lodger, who had, as he affirmed, come for the benefit of his health; and better still for her—as she was imparting to a neighbour who had dropped in for a cup of tea—her lodger had paid a month in advance—and such a pleasant gentleman too. The pity was, however, that he was deformed, he being a hunchback.

‘Ay, poor man,’ returned Mrs Miller, ‘it is a pity; but do you think he will stay any longer than the month?’

‘Well,’ returned Mrs Spellert, ‘he says if the place suits him he will, as he gets plenty of sport in his fishing.’

Their conversation was cut short by the entry of the gentleman in question, who, on seeing Mrs Spellert and her visitor rise, begged of them

not to disturb themselves, and inquired of the landlady what time the mail left the village.

‘Six o’clock, sir,’ was the answer.

‘Thank you. That will do nicely,’ said Mr Besley, for such was his name; and passing through the kitchen, he limped up-stairs to his bedroom, he being lame, in addition to his deformity. On arriving there, he quietly locked the door, drew the blind partially down, took off his smoke-coloured spectacles, which was nothing extraordinary, then took off his coat, and with it his hump, which was extraordinary. He then removed his gray beard, which was also false; his limp, too, had disappeared; and he stood a complete metamorphosis from a man apparently about sixty years of age to one really about thirty.

‘Phew!’ he muttered; ‘these things swelter a fellow to death. One good job will be I shall soon have done with them. But now to business. What’s about the time? Ha! five o’clock—just nice time to write to Jim before the old lady gets my tea ready.’

What he writes will give us some insight into Mr Thomas Besley’s character, and the reason of his visit to this out-of-the-way village of Tripley.

Sept. 23, 18—.

DEAR JIM—All’s serene, and everything has worked finely so far. The old lady I am staying with was housekeeper at the Hall, and so I have pumped her well as to the lay of the premises, the back part of which is only separated from this cottage by a thick fir plantation. So I paid a visit there last midnight, dropping quietly out of my room window when all was quiet; so, what with my landlady’s garrulousness and my own natural inquisitiveness, I think I know the bearings of the place. We will commence operations at the back of the Hall, where I have made everything right. As we heard, there will be a large gathering of relatives and friends on a visit, to celebrate the son’s tenth birthday on Saturday, when there will be a grand display of fireworks, which will be given well to the front of the Hall, for safety, from about half-past eight to ten, which must be our time to sail in. Mare and trap as usual. Tell Tom to make for Tripley, and be in the Downleigh lane not later than half-past nine. You must meet me on the old bridge at seven. More when I see you, as the post goes out so confoundedly early. Hope your arm is better and fit for work.—Yours,
TOM.

The letter was sealed carefully; and then dressing himself for presentation to the outer world, he went down-stairs and into the village post-office.

The next day was spent in fishing; and in due course on Friday morning he received an answer to his letter. It was very brief: ‘DEAR TOM—Right you are; will be on the spot. Unfortunately, arm is still painful.—Yours, JIM.’

Mr Besley as he was having his tea on Saturday kindly informed Mrs Spellert ‘that he should go and fish for an hour or so that evening; she need not, therefore, stay in on his account, but go to the fireworks with other people. He would get home when they were over.’ Mrs Spellert was only too pleased, as

everybody in the village intended going to see the display.

Mr Besley took his way toward the river about six o'clock with rod and creel; but when he got to the river-side he dropped these articles into a ditch hard by and proceeded to his appointment. Coming to the bridge where the road crossed the river, he saw a clerical-looking man standing there, who, on seeing Mr Besley, came down the steps at the side to meet him. He carried a dark leather bag, and was evidently about fifty years old.

'Is all right, Jim?'

'Right as the mail, Tom.'

'And now, my lad, I'll put you right as to the ins and outs of this job,' said Mr Besley. 'As I told you, the house must be cracked from the back. The Hall has been built at two different times, the back part as it now is having formerly been the old Hall. But when the present Squire married he made an addition to the front of the old mansion, then he cut a new road round the front of the new part. The old road is really, therefore, closed and very gloomy.'

'Couldn't be better for us,' interposed Jim.

'Moreover, I find,' continued Mr Besley, 'that when the old man died in the old part, the servants got it into their heads that the rooms were haunted; consequently, they are not used except for lumber. So my plan is this: all the village and the servants will be at the front of the Hall; so we will get into the plantation at the back, and as soon as the first rocket goes up, in we go, and in five minutes on the spoil.'

'Any dogs?' queried Jim.

'Not at the back, anyway. You see, the old house was enclosed by a wall, which is still left, and the enclosure used as a kitchen garden, quite retired from the front. Now, we had better be moving over yonder.'

The pair walked slowly on until they came to the road from which they were to commence operations, and were soon at the back of the Hall, and among the trees out of sight.

'What sort of lock is the outside?' asked Jim.

'Only an old-fashioned one,' said Tom; 'and the house door is no better.'

The bag was now opened, and each man slipped on a pair of rubber shoes. The time was drawing on; so Tom moved across the road, and cautiously but quickly, under the shelter of the overhanging ivy, turned a skeleton key in the lock. Jim was soon at his side; and after listening a moment, both went inside the door, which they then fastened by a piece of board.

'Door opens quietly enough,' whispered Jim.

'I took the liberty to oil them all the night I visited here,' was the ready answer.

The house door was next tried, and soon unlocked.

'Ha!' said Tom, 'there goes half-past eight, and true to time, up goes the first rocket.'

As he spoke, it whizzed skywards. Before the stick could have fallen, they were inside the old Hall; and as it was a dark autumnal evening, they lit their bull's-eyes, disclosing the Hall and the stairs.

'So far, so good, Jim, lad. Now up we go.'

Up they went without the least sound; and were soon at the top of the landing. Here they

turned through another door into what had evidently been the old Squire's bedroom. This room they now left by another door, which opened into a long passage, at the end of which was the dividing door between the old and new parts.

'Now for it,' whispered Tom. 'This is a snip!' (a locked door with the key left in on the opposite side).

An instrument like a fine pair of ladies' grooved curling-irons was produced, which he inserted into the keyhole, and gripping the end of the key firmly, he quietly turned it round and unlocked the door. Had any one on the other side seen the key turn so mysteriously, he might have imagined that of a truth the ghost was about to pay a visit.

In less than ten minutes from the time they opened the outer door, they stood in the new part of the house. Producing another bag from the interior of the one carried, they proceeded along the passage towards the front of the Hall, and took a room to the right for a commencement, which was evidently a ladies' room. They had scarcely entered, however, before the sound of a quick footstep was heard ascending the stairs. Jim suppressed an oath, his companion motioning in dumb show, both dropped behind a cheval glass which stood handy. Whoever was coming, was arrested on the stairs by some one calling: 'Mary, bring Lady Trevor's wrap also, and be quick, or you will miss the next piece.'

'Bother Lady Trevor!' ejaculated Mary, and in another instant she was in the room, came close to the cheval glass, and hurriedly snatched up what she wanted from a lounge in front, and ran down-stairs again.

'Only a minute's delay,' growled Jim; 'but it perhaps means losing a ten-pound note.'

They lost no further time, however, for any valuables that lay handy were swept into their capacious bags. Thus they proceeded through the different rooms with great celerity, proving they were not novices. If a drawer proved awkward, a little persuasion with a small jemmy soon gained an entry, the outside noise drowning theirs.

'This will be about the last room we can venture, Tom,' said his partner. 'What's the time?'

'Just a quarter past nine. I think we had better make a move.'

Looking through a corner of the window, they perceived there were four more pieces to let off in addition to the piece of the evening.

'Many happy returns of the day. Jim, my boy, they won't wish us many happy returns, when they find our little game out.'

'Not exactly,' said Jim with a grin.

They both slipped out of the room, when Tom stopped. 'Jim, from the looks of the fireworks they have to let off, they will be a good hour yet. Are you with me to slip down the back stairs, just for a venture of ten minutes, and getting a bit of plate from the butler's pantry? I think I can spot it directly.'

'In for a penny, in for a pound,' replied Jim. 'Down we go.'

So, leaving the one bag in a recess, they slipped quickly down-stairs, and guided by Tom, who had been enlightened by innocent Mrs Spellert,

soon were packing a goodly quantity of the silver into the bag. They were just thinking of returning, when in the midst of their success they were seemingly to be thwarted, for they heard the outer door open and close, then some one came along the Hall directly for where they were. Jim put his mouth to the other's ear: 'Lay hold quick, if he comes in here!'

'He'—for it was Mr Parker the fat apoplectic old butler—did come in, and to his astonishment he thought the door fell upon him, and he knew no more for the time being.

'We shall be nabbed yet; out with you!' ejaculated Tom, who, notwithstanding he had faced danger many times, felt his legs tremble a little. Just then the Hall clock went the quarter to ten.

The top stair was reached, the first bag taken from its recess, and in another minute they were once more in the Squire's room with a bolt slipped behind them. Here the old proverb was exemplified, 'Much will have more,' by Jim noticing the Squire's old-fashioned silver watch and seals, which were twisted round a nail with a black ribbon near the bed. Jim thought he would have them, but could not very easily detach them from the nail.

'Don't be a fool,' said Tom; 'we shall both be lagged.' But Jim was stubborn, and after a minute's delay, snatched ribbon and nail together, and dropped it amongst the other valuables in the top of his bag, saying as he did so 'that it would weigh with the rest.'

Tom fumed into an oath, and at that they proceeded down-stairs, then outside, and stood once more in the lane.

'How far is it,' inquired Jim, 'to the other bridge?'

'A mile and a half quite, so best leg foremost,' replied Tom.

They had proceeded about half the distance, when suddenly the Hall bell pealed out with a clang, clang through the still night-air. 'There goes the signal,' said Jim. 'They must have found out our game, and my arm feels as if it had started to bleed again. It must be the weight. I am ready to drop the bag. What's to be done?'

Tom ground his teeth in vexation at this, and answering, said: 'The police and every one else, now they have heard that bell, will be coming this way for a short-cut; and these bags will create suspicion. The police station is not far from the bridge. We dare not turn back. As it is, we are bound to meet a dozen perhaps, including police.—I have it. We will sink the swag here in the river; the water's deep, and we will fetch it later on, when things are quieter. Give me some wire, quick.'

A ring of strong wire was quickly produced by Jim, then wound and twisted through the handles of the bags; both were then dropped gently into the water, the wire paid out until they touched bottom. The other end was then fastened round a willow stump partially under the water.

They sprang to their feet. 'Now, Jim, when we meet any one, understand there's a fire at the Hall—the stables will do.'

'Right,' said Jim; and off they set at a good pace. They had left their spoil perhaps a hundred yards when the form of a policeman loomed

up, and a labourer with him. He came up to them at a quick pace, and when he reached them, they could see he was a young beginner in the force.

'Is the sergeant at home, my man?' said Tom, with an officious air, acting as spokesman, which caused the policeman to touch his cap—'as the Squire asked us to run round and tell him that the stables were on fire.'

'And I'm blest if I didn't think so, sir, as I was coming along my beat,' was the policeman's reply. 'It's them fireworks, I'll lay a crown.' And added he: 'You'll meet the sergeant; perhaps you'll tell him, sir; I must be off.'

And off he accordingly went with his companion at a run. They met several farm-labourers, and passed them quickly on, with a laconic, 'Stables on fire!' They were soon on the bridge, and there met the police sergeant face to face. Tom was even astute enough to send the sergeant after his man with the same tale.

Breathing freer, they soon put the remaining distance between them, and reaching the lane, gave the signal; and in a few minutes were in the trap and spinning away with Tripley far behind, and Jim almost in a faint with pain from a wound in his arm, the result of a previous midnight raid.

Two days after these events, a long canal boat, similar to those seen any day passing along our inland canals, came slowly along the stretch of water by which Mr Besley and his companion had passed. The boatman was taking his turn at the helm, his wife leading a sorry-looking nag, which towed the boat. He was thinking to himself of the many good fish he had taken from this particular stretch of water, and wishing he had the time for a spin at that moment. Turning his helm sharply at a slight bend, he heard a sudden swish, and a splendid pike, which had been sunning itself, dashed under the pollards which lined the opposite bank, leaving a miniature line of foam on the water.

He uttered an exclamation of astonishment and regret that he had not his boat-hook handy, to have struck it with. 'Twenty pounds if it were an ounce,' he gasped; and, forgetful of his helm, he turned, staring in astonishment at the spot they were slowly leaving, when he suddenly found himself running into the bank. 'I should like a chance at that joker,' thought he, as they went along; and to his joy, when they arrived at the lock, he found they would have to wait until the wharf manager came from his dinner, as he wanted to see him.

'That means a good hour,' said Sam the boatman. 'I'll try my luck.'

Sam quickly got his rod and tackle and was soon on the spot. After a fruitless half-hour, he began to think it would be of no use. 'The beggar ought to be hereabouts,' he grunted as he put on a fresh bait; when, at the end of another ten minutes, just as he thought he heard a halloo, swish, down went his float, and whirl went the reel with tremendous velocity.

Sam's legs trembled for the moment; but though excited a little, he knew how to handle his fish. He spent a good half-hour giving him plenty of line, and winding him in whenever he got a chance, groaning in vexation that he

had no one to give him a hand with the gaff hook.

Meanwhile, the wharf manager had grown impatient, and set out after Sam. As soon, however, as he reached him, he forgot to reprimand, and entering into the spirit of the sport, seized the gaff hook, and soon landed the fish.

'Egad, Sam, you're lucky to catch such a beauty. Look at his mouth; he's given somebody some sport—there's half-a-dozen hooks in it!'

'Hallo, Mr Wills, what have you got there?' some one said at the moment; and looking up, the manager saw the Squire. He was equally surprised at Sam's splendid catch, and promptly offered him a sovereign for it, which was accepted. The Squire arranged that Sam should take the fish to the lock-keeper's, where he would send for it from the Hall.

After Sam's departure, the wharf manager inquired whether any further clue had been found as to the burglary.

'None whatever,' answered the Squire, 'beyond the fact that the two men who doubtless committed the robbery came this way, got to the bridge here, deluded the police, who identified one as a Mr Besley; and after that disappeared, no doubt being disguised at the time.'

The Squire now took his way back to the Hall; and when the pike arrived, ordered it to be packed in a hamper and forwarded to a noted firm in the City to be preserved and cased.

Two mornings later, the Squire sat at breakfast; most of his friends had departed, not more chagrined than he at the loss of the valuables. After the more important letters, he carelessly opened the letter of acknowledgment from the firm of taxidermists; but instead of the formal letter, his attention was riveted by the following:

October —, 18—.

SIR—Pike received safely, and shall be returned as soon as finished. You will be surprised to learn that on opening the pike we found an old-fashioned silver watch and seals with ribbon attached. On examining it, which from appearance had not been in the stomach very long, we found your late father's name engraved inside. We have therefore forwarded it as we found it, per same post as this letter, trusting you will receive it safely.—Your obedient servants,

BELL & SWIFT.

The package was opened, and the watch identified at once.

'Now, however did the pike get hold of this!' was his exclamation, as he passed the letter to his wife.

She advised that Detective Vean, whom they knew as a clever officer, should be at once telegraphed for. And the suggestion was acted upon.

In a few hours he arrived, and all the facts were laid before him. It did not take him long to arrive at a decision.

'It's as plain as a pikestaff what this precious pair have done. They must have had something to put their plunder in—that is a certainty; but, according to the sergeant and other evidence, the two had nothing of the kind when they were met. Then it remains thus—the alarm came too quickly for them; they had no outlet but to

keep straight on for the bridge; therefore, they have planted their booty until a more convenient time. I propose, then, sir, seeing that the watch came from the river, to explore that first.'

Having obtained the boat hook, he dropped it into the water, and walked slowly along, now and again catching it in a piece of river weed or a submerged willow twig. Thus they proceeded, and with a few such false alarms, were rewarded at length by the boat-hook catching the wire. Stooping down, and giving the hook to the Squire, he exclaimed, as he plunged his arm into the water: 'I think we have got something solid this time.'

Looking around to see that no one was about, he carefully drew up the wire until the bags were nearly at the surface; then, with the Squire's assistance, the two bags were laid on the path, one being partially open.

'That explains how Mr Pike got hold of the watch, sir,' laughed Detective Vean.

Running the water from the bags, and taking one each, they went back to the Hall, the detective begging the Squire not to mention a word to any one that he had recovered the valuables, not even to his friends whose property had been stolen.

'You see, sir, it won't hurt them to wait a little longer, as they will be sure of them eventually, though they don't know it; and I shall almost be sure to capture the thieves when they come for their booty. I will wait until dusk, and then plant these bags again with a few brick ends inside them instead of valuables, and then set a watch.'

Two days afterwards, the Squire was notified by the police that Mr Besley and his associate Jim, who were disguised as farm-labourers, had the night before been taken in the act of putting the bags into their trap.

Detective Vean had done a good piece of work, and he was quite satisfied with that and the Squire's present of a fifty-pound note. He was further satisfied at the assizes, when the pair received sentences of twenty years each, they being old offenders.

The look of astonishment each offender gave was a study, when the facts of the pike and watch were given in evidence; and when they turned and left the dock, Jim's expression was: 'Well, I'm blown! A splendid job like that spoiled, and us lagged for twenty years all through a blessed pike!'

STORY OF A FRENCH INVASION.

THAT the sacred soil of the British Islands was desecrated by a French campaign within a hundred years ago is known to comparatively few; fewer still are acquainted with the details, English historians contenting themselves generally with a bare mention of the fact. Although the occurrences about to be narrated took place in the west of Ireland, yet they were of so extraordinary a nature that a history of them will be found interesting.

By way of preface, it may be necessary to say that the Irish rebellion of 1798 had just been suppressed, and although during the rising the

Irish had looked to France for aid, for one reason or other it had not been forthcoming, until, fortunately for the British Government, it was too late. On the 22d of August 1798, as the Bishop of Killala, County Mayo, was holding a visitation of his clergy at his residence there, three frigates, two of forty-four guns and one of thirty-eight, under English colours, entered the bay and dropped anchor. Two of the Bishop's sons and the Port Surveyor rowed out to the ships with the intention of boarding them; on doing so, they were informed, to their great astonishment, that they were the prisoners of the French Republic. The same evening about three hundred French troops were landed and immediately advanced on the town. Notice was instantly sent off to Ballina, seven miles to the southward, where a small English force was stationed; and meanwhile the garrison, composed of yeomanry and fencibles to the number of fifty, gallantly advanced to meet the invaders. Being overwhelmed by numbers, however, and losing two of their party by a fusillade from the French, they turned and fled, twenty of them being taken prisoners. Thus the French effected a landing and gained possession of Killala. The whole forces of the French were now landed, consisting of about eleven hundred officers and men with two guns, under General Humbert; but they calculated on being joined by the Irish malcontents, for whom they had brought arms and uniforms. Next morning, an advanced column of one hundred men, of whom forty were mounted on horses 'requisitioned' for the purpose, advanced on Ballina, and were soon followed by the main body. On the evening of the 25th they entered Ballina, the garrison of which fled after a faint resistance. Here several hundred Irish joined the standard of the 'Liberators,' making, together with those who had joined since the landing of the French, about fourteen hundred auxiliaries. Humbert, encouraged by these additions to his forces, determined not to give them any time for reflection; but advanced at once on Castlebar, the chief town of Mayo, where a large British force was stationed.

The troops at Castlebar, made up mostly of militia and yeomanry, in a bad state of discipline, numbered about four thousand, with fourteen guns, under General Hutchinson; but at the last moment General Lake, as senior officer, took over the command, which occasioned great discontent and some confusion among the troops. The French were expected to advance by the main road from Ballina, on which a force had been stationed to watch them, and the British dispositions were made accordingly; but Humbert, who was a veteran in the art of war, chose a road by which he was not expected, namely, to the west by the Pass of Barnagee, which had been considered impassable, and so came upon the British on their left flank. When Humbert came in sight of the formidable array opposed to him, he concluded that surrender must be his fate; but, all the same, determined to make at least some show of resistance. The English, on the other hand, had been taken unawares; and,

surprised by the flank movement of the French, had hastily to take up a new position about a mile from their former one. This, and the warlike appearance of the French troops, did not tend to increase their confidence. The French advanced on the right and left of the English position in small bodies amid a cloud of smoke, and under a smart fusillade and hot fire from the English artillery, which, however, did not check their advance. The English, becoming alarmed at the unusual tactics of the French, and by a movement to turn their left, which unfortunately was undefended, retreated, were seized with panic, broke, and fled in confusion through the town, cavalry and infantry mixed in wild disorder. A more disgraceful defeat had, in short, seldom befallen the British arms. Artillery, ammunition, arms, and everything that could impede their flight were abandoned to the enemy. On they fled to Tuam, thirty-eight miles from the field of battle. After a short rest, they posted on again towards Athlone, where an officer of carabineers and sixty men arrived at one o'clock on Tuesday the 28th, having performed a march of eighty miles in twenty-seven hours, a no small achievement if it had been for a better purpose. It is impossible to say where the fugitives might have stopped if their flight had not been arrested at Athlone by the arrival of the Viceroy, Lord Cornwallis, of Yorktown fame. This marvellous flight was derisively called by the Irish, 'the Races of Castlebar.'

The French now took possession of Castlebar, the only resistance offered them being from a small body of Highlanders, who chose rather to face the enemy than join in a disgraceful flight. The losses of the English, in killed, wounded, and missing were said to be about three hundred and fifty.

The French celebrated their victory in a characteristic fashion: the officers gave a ball and supper to the ladies of the town; and so well did they deport themselves that they very soon became general favourites. But business had to be attended to as well as pleasure. Having by his victory gained possession of Mayo, Humbert immediately established a Provisional Government and formed districts, over each of which he placed a magistrate; and, to make all complete, appointed a Mr Moore, a gentleman of the district, as Provisional President. Proclamations were issued in the name of the Irish Republic, and supplies, &c. were paid for with notes on the Irish Directory. Having made all ship-shape and done everything calculated to impress the natives with a sense of the power of their allies, the next move had to be considered, for Humbert very well knew that he would not long be allowed to remain in undisturbed security.

While Humbert was thus busily employed in providing a constitution for the new republic, the Viceroy was becoming alive to the gravity of the situation. The malcontents, encouraged by the successes of the French, were threatening to assemble in large numbers, with the ultimate design, it was said, of joining the French and marching on Dublin. On receiving news of the defeat at Castlebar, Cornwallis hastened by forced marches in the direction of that town. He arrived on the 4th of September at Hollymount,

fourteen miles from Castlebar, and was preparing to advance, when he received information that the French had abandoned their position and had marched in the direction of Foxford.

Humbert's position was critical; his Irish auxiliaries, additional numbers of whom had joined him since his victory, could not be depended on—were, in fact, utterly useless, some of them, indeed, never having seen a gun before. He knew that at the slightest check they would desert him; they had a too lively recollection of the horrors of the late rebellion. Humbert had, in short, expected to receive more substantial aid from the Irish; he had also expected reinforcements from France, but now saw that they could not arrive in time to do him any good. Nevertheless, he determined to do his duty, and prolong the campaign as far as possible. He therefore abandoned Castlebar on the 4th of September, and turned north-east towards Foxford, with the intention of reaching Sligo, where he had a faint hope his reinforcements might yet land. Humbert now found himself followed by two bodies of troops, one under Colonel Crawford, and another under General Lake, which hung upon and harassed his rear. A third, under General Moore—afterwards Sir John—watched him at a distance; while Cornwallis with the main army marched parallel with him towards Carrick-on-Shannon. As if this were not enough, on reaching Colooney on the 5th, about forty miles north-east from Castlebar, Humbert found himself confronted by a fifth force, under Colonel Verreker, of the Limerick militia, with a force of three hundred and thirty men and two currie guns. A fierce and obstinate fight ensued—this was indeed the only real battle of the whole campaign—but after lasting about an hour, Verreker, finding himself overpowered by numbers, was compelled to retreat, with the loss of his guns, to Sligo.

Although Humbert was victorious in this encounter, it caused him to change his plans. He now marched towards Manorhamilton by Drumnahair, abandoning eight of his guns by the way; but in approaching the former place suddenly turned to the right, in a south-easterly direction by Drumkerin, and attempted to reach Granard, in Longford, where a rising had taken place. His rear was now constantly harassed by the enemy, and on the 7th a smart skirmish took place with Crawford's advanced guard, in which the French were victorious. Humbert now crossed the Shannon at Ballintra, but so closely followed that his rearguard had not time to break the bridge. He halted some hours at Cloone, to give his worn-out troops a brief rest, and arrived next day, the 8th, at Ballinamuck.

The Viceroy, crossing the Shannon at Carrick, was meanwhile marching on Saint Johnstown, in order to get in front of Humbert on his way to Granard. The drama was now drawing to its close. Completely surrounded by an overwhelming force, Humbert saw that surrender was inevitable. For the honour of France, however, he determined to make at least a formal resistance; he therefore disposed his forces in order of battle and awaited the attack. His rearguard was attacked by Crawford, and, being overpowered, surrendered; and the remainder, after resisting General Lake for half an hour, laid

down their arms—the whole force amounting to about eight hundred and fifty, the rest having been killed or wounded since the beginning of the campaign. The entire British force which surrounded Humbert numbered about thirty thousand, or five thousand more than were employed at Waterloo, or, in later days, at the battle of the Alma.

While the French received honourable terms of surrender, the Irish auxiliaries, in number about fifteen hundred, were shot and hanged without mercy, five hundred of them being killed in this way.

The closing scene of the drama was the recapture of Killala, which had remained in possession of the French, or rather of Irish insurgents under two or three French officers. It was not until the 22d of September that the royal forces, twelve hundred strong, arrived at Ballina, the Irish garrison fleeing at its approach. The English advanced on Killala in two columns, from the north and the south. The garrison posted themselves on the Ballina road, but were speedily overcome, and fled through Killala, pursued by the cavalry. At the other end of the town they were intercepted by the second column, and about four hundred of the unfortunates were killed.

In this extraordinary campaign, which lasted from the 22d of August to the 8th of September, the French had marched one hundred and thirty miles, penetrating to the very heart of Ireland, and distant only sixty miles in a straight line from Dublin, and had fought five engagements, in all of which they had been victorious. Why a handful of French troops should have achieved such success was not so much due, after all, to their own prowess, as to the nature of the forces opposed to them. These were mostly local militia, quite unused to real war, and some of them disaffected, and not inclined to fight very hard against those they secretly regarded as their friends. It is related that a number of militia, who were put down as missing after the affair of Castlebar, had gone over to the French; one of them, on being afterwards asked why he had done so, replied, that 'it was not he who had deserted, but the British army, who had run away and left him behind to be murdered!'

SONNET ON CHRISTMAS.

How have they dawned on us, those Christmas days,
The birthdays of the Friend as yet unseen?
In childhood's far-off vale with gladness keen
A wonderland of brightness to our gaze;
Then, the slow change, as creeps the autumn haze,
The vision fades to thoughts of what has been,
Of voices that we miss, and altered scene,
And feet that walk no more on Life's highway.
Yet through all change, the Christmas star shines on
Lonely and lovely; though the earth-lights die,
The soul looks up, and finds its goal at last,
And asks no more, nor sighs for pleasures gone.
One day its Christmas shall be kept on high,
With all Life's hopes fulfilled—its sorrows past!

BOTANY BAY.

THE waves rustle at my feet on the long curving bar of sand, too lazy to break, excepting here and there on an outcropping ledge of rock. A boat lolls lazily at its anchorage, the anchor-rope shining like a line of silver hung with pearls as it dips and comes up dripping from the water. The gulls wade about in the shallow pools, or paddle into the dimpling wavelets, calling harshly to their neighbours, sailing backwards and forwards in short flights; and the latter drop down to compare notes. They come up quite close, tempted by the scattered shells and weeds, so close that it is easy to distinguish where the soft dun gray of back and wings shades off into the pearly white of the breast and under parts. They seem proud as any tan-booted lady to display their handsome little webbed feet, which, with the strong beak, make a pleasant contrast to the rest of the body. They will be away shortly out there over the wide Pacific, the boom from the breaking waves of which is carried faintly to the ear. High overhead a sea-eagle floats almost without motion. A school of porpoises come bouncing and rolling along; and presently the dorsal fin of a shark makes itself visible where the water shallows. The Bay is a favourite haunt of the finny pirate. Give him a show of making a dinner at the expense of your leg, and see if he is as lethargic as he looks.

The drip, drip of the water over the rocks behind has a restful sound, and the simmer of the soft breeze through the metallic foliage of the gums helps to temper the hot sunshine. Capes Banks and Solander stand out boldly at the entrance of the Bay; and away to the southward stretch the line of low coast hills, Cape Bass—if I have not travelled too far to the southward—forming the boundary of vision. A black pillar of smoke rises up from behind the Cape. The smoke means that there is a bush-fire raging somewhere on the fat Illawarra plains. The undulating pall of bush has borrowed a tender

blue from the sunlight, which somehow seems to diminish the distance and add to the distinctness. The sun will be dipping shortly, and will change the slopes into meadows of purple gold, and the Bay into a plain of crimson and roseate; while the shadows will gather under the line of coast-cliffs. Then the boats will come crawling out, to steal away to the fishing-grounds. The dip, dip of the oars and the rattle as they swing in the rowlocks travel far through the stillness. To the left, just inside the Heads, rises a tall monumental pillar, backed by a couple of Norfolk Island pines. The sight of the pillar sets me dreaming about the French navigator La Pérouse, and, as a natural consequence, Captain Cook soon treads on the heels of the Frenchman. Under the influence of a pipe, the warm sunshine, and the soft breeze, I slip fairly into dream-land, to wander with Cook among the pleasant fields of his native moorside Yorkshire village of Marton—wander in my own far-away county, where the bonnie Cleveland Hills now, as ever, keep watch and ward over my home.

‘Bacca, Boss.—My word, him sleep.’

It was one of the aborigines from the small camp at the point who had rudely broken into my dream, and who valued his services at sixpence as well as the ‘bacca.’ My word, ‘him’ had slept—slept until the night had descended over sea and hills and sloping bush. The rush of the rising tide comes breaking in from the Heads, while the rustle along the bend of sand has given place to a low plashing and sobbing.

Let us turn back the leaves of time for one hundred and twenty years. In the waning light of one of the closing days of April 1770, there comes beating up from the southward the good ship *Endeavour*, three hundred and twenty tons, Captain James Cook. Captain Cook, after observing the transit of Venus at the island of Tahiti—the primary object of his voyage—is now bent on carrying out his other and, most certainly to him, congenial instructions—‘the making of further geographical researches.’ He has circumnavigated New Zealand, and then, sailing west-

ward ho! has, after three weeks' knocking about in the Pacific, struck the coast of the almost unknown, wholly unexplored *Novæ Hollandæ*—Australia, the Great South Land. Northward he has crawled under the unbroken, uninviting wall of rock, and gazed on the illimitable monotony of sombre forest beyond it. And now at last, on this late April evening, he has discovered a break in the chain. The head of the little *Endeavour* swings round; she feels her way between the two rocky headlands, which, when she bids them farewell, will bear the names of the two intrepid naturalists who accompany Cook, Dr Solander and Mr (afterwards Sir Joseph) Banks. She slowly steers across the cove which forms an elbow at the entrance, passes Bare Island, and then fairly enters the placid waters of the Bay. Captain Cook's quaint Journal tells how he tried to hold converse with the natives—'Indians,' as he calls them—how they were so hostile that he tried to persuade them to reason with a 'Brown Bess'—and how this reasoning failed to have the wished-for effect, failed even to strike fear into the hearts of the untutored savages.

The name Botany Bay is its own expositor. Perhaps not anywhere in the whole world would it be possible to find such a lavish waste of flowers as along the coast hills of Australia in the early summer months. The English summer is garlanded with blossoms; but ever there is the predominating, relieving green of the grass and foliage, which, abundant as the flowers may be, makes superabundance an impossibility. Excepting where the mangrove swamps occur, a noticeable feature of Australian coast scenery is that between the timber-line and the wave-limit there is generally a belt, often narrow, but in some places swelling out into wide downy reaches, clothed with dwarf-bush and a tangle of heaths, vines, and an almost unending variety of flowers and shrubs. The very nature of every item of the flora of Australia—trees, shrubs, plants, grasses, mosses—would appear to be to bear blossoms, and not blossoms that are pale, but the brightest reds, purples, blues, yellows, and the purest whites, with the infinity of shadings the sunlight evolves out of these ground colours. With this glowing mass of petals the brightest of green foliage is looked for, and, failing this contrast, a sense of oppression is born—the same sense of oppression that makes itself felt in an art gallery, where the very variety and the lavish display of pictures seem to absorb the personality which alone appeals to the artistic.

It is not to be wondered at that the botanists of Captain Cook's expedition should have christened the newly-found haven as they did. Six-score years have gone since Mr Banks and Dr Solander were fascinated by the wonderful variety of native flora, yet to-day the haven is as appropriately called Botany Bay as it was when Nature reigned supreme. The immediate

vicinity of the historical portion of the Bay has undergone very little change. The bare sandy dunes of the southern shore mirror back the glistening shafts of sunlight, just as they must have done on that April day in 1770. There is one solitary house breaking the golden curve of bush-backed sand, and that is all. The northern shore, however, is the centre of interest. Massive old gum-trees, with their curiously-twisted trunks and arms in places sweeping almost into the water, shadow and cling to the rocks, in the damp cool crevices of which nestle a thousand ferns and flowers. Many-coloured vines and parasites link tree to tree with pendent floral chains. Under the pleasant shade of the primeval giants and their under-roofing of vines is the everlasting carpet of flowers.

It is anything but an easy task on an Australian summer day to break through the thick tangle of undergrowth; yet any one that will persevere will not be without his reward. In the wealth and variety of orchids alone is a life's delight. On the flats where the timber bends to the black swamp, and along the sparkling creek that runs out of it, they grow thick. Around that swamp a botanist might spend weeks and months without exhausting its treasures. It is a garden of tropics, compared with which the best-stocked hothouse would sink into insignificance. Sweet is the breath of the salt sea—sweet with its own fresh sweetness, and it is made sweeter still by the aroma of the acacias and honey-gums. Amongst the trees, in place of the pleasant rustle of fallen leaves, there is the crisp crunch of the dried gum-bark, which thickly strews the ground. Bright-plumaged birds and gem-like butterflies and insects flit and flutter about; watchful-eyed lissom lizards bask on every stone and trunk; occasionally a snake, beautiful in spite of its sinister associations, shuffles away to cover at the sound of a footstep; and the mosquitoes must not—will not—be forgotten.

Botany Bay boasts a river. At its eastern end, where now stands a fashionable watering-place, George's River, known in its higher reaches by the pleasant-sounding native name of Woniora, empties itself. The exploration of this river opens out a very paradise of wood and flower-land.

After a short stay, the *Endeavour* sailed away northward from Botany, past, and without discovering, Port Jackson, the finest harbour in the world, the only remnant of Cook's visit being the Union-jack which he left floating on the North Head. For seventeen years the 'Indians' were left in peace. Then came Captain Phillip with the 'First Fleet'—a fleet of eleven convict ships, crowded with five hundred and sixty-four men and one hundred and ninety-two women convicts. He came to found a new nation, the American War of Independence having made it necessary that some other outlet should be found for emptying England's prisons. Phillip soon

ascertained that, beautiful as Botany Bay might be, it was not fitted for settlement. The land was not suitable for cultivation; water was scarce, and the Bay was too shallow to allow of vessels approaching within reasonable distance of the shore. With commendable promptitude, he discovered and shifted his quarters and his convicts to Port Jackson. But short as was Captain Phillip's stay, it left a taint on the name of Botany Bay which was long regarded as synonymous with convictism. While round the shores of Port Jackson, the very centre of convictism, has grown up a city of four hundred thousand inhabitants, Botany Bay has been left pretty well in its primeval state. In real history it has become redolent only as the site of tanyards and other noxious trades, and as the rallying-ground of Heathen Chinese gardeners. There are scattered houses along the eastern and part of the northern shore; but the interesting portion of the fore-shore and adjoining bush remains almost as wild as when Captain Phillip broke camp. The presence of the small settlement of aborigines at the point helps to heighten the primitive character of the surroundings. At one time a custom-house stood at Botany Heads; but as in all things else, the custom soon drifted to the successful rival, and now the old custom-house has descended to a commonplace dwelling.

Not the least interesting relic of Botany is the monument raised by his countrymen to the ill-fated French explorer La Pérouse. It stands up a tall plain monolith, backed by two towering Norfolk Island pines, bearing inscriptions in French and English to the memory of the explorer and his companion voyagers. Scribbled everywhere over the pillar are the names of Frenchmen. Only a few days after Captain Phillip had effected a landing, two strange vessels came to an anchorage in Botany Bay. These vessels proved to be the French exploring ships *Thétis* and *Esperance*, commanded by La Pérouse. Phillip's landing a few days previously saved Australia from becoming a dependent of 'La Belle France' instead of a possession of His Britannic Majesty, George the Third. La Pérouse, disappointed doubtless, stayed and refitted his ships, after which he sailed away southward into the unknown, to be heard of no more until the bones of the *Thétis* and *Esperance* were discovered bleaching on the reefs of the islands of Santa Cruz, where the French commander and his crews were murdered by the natives.

Botany Bay is one of the favourite picnicking and fishing-grounds of the Sydneyites. It lies between six and seven miles from the heart of the city. A tramway carries pleasure-seekers beyond the far-reaching suburbs, and then through a long stretch of sandy swamp-land, until late years, the source whence the city water-supply was drawn, but now a luxuriant wilderness of Chinese gardens. To reach the picnicking ground, however, the would-be worshipper of Cook and Phillip and La Pérouse has yet to traverse as high smelling a section of the round earth as can be sampled up from anywhere, a whole colony of tanneries and boiling-down houses having located themselves there.

Such is Botany Bay after six-score years of advancement have passed over it. Starting with

a tarnished name and the disadvantage of shallow waters, it has remained and is likely to remain a silent stretch of sea in the midst of a beautiful tropical flower-garden—a Botany Bay in reality.

BLOOD ROYAL.*

CHAPTER XVIII.—GOOD OUT OF EVIL.

THAT journey back to town was one of the most terrible things Maud had ever yet known in her poor little life. Dick leaned back disconsolate in one corner of the carriage, and she in the opposite one. Neither spoke a single word; neither needed to speak, for each knew without speech what the other was thinking of. Every now and again Dick would catch some fresh shade of expression coursing like a wave over Maud's unhappy face, and recognise in it the very idea that a moment before had been passing through his own troubled mind. It was pitiable to see them. Their whole scheme of life had suddenly and utterly broken down before them: their sense of self-respect was deeply wounded; nay, even their bare identity was all but gone; for the belief that they were in very truth descendants of the royal Plantagenets had become as it were an integral part of their personality, and woven itself intimately into all their life and thought and practice. They ceased to be themselves in ceasing to be potential princes and princesses.

For the Great Plantagenet Delusion, which Edmund Plantagenet had started and only half or a quarter believed in himself, became to his children from youth upward, and especially to Maud and Dick, a sort of family religion. It was a theory on which they based almost everything that was best and truest within them; a moral power for good, urging them always on to do credit to the great House from which they firmly and unquestioningly believed themselves to be sprung. Probably the moral impulse was there first by nature; probably, too, they inherited it, not from poor drunken, do-nothing Edmund Plantagenet himself, through whom ostensibly they should have derived their Plantagenet character, but from that good and patient nobody, their hard-working mother. But none of these things ever occurred at all to Maud or Dick; to them, it had always been a prime article of faith that *noblesse oblige*, and that their lives must be noble in order to come up to a preconceived Plantagenet standard of action. So the blow was a crushing one. It was as though all the ground of their being had been cut away from beneath their feet; they had fancied themselves so long the children of kings, with a moral obligation upon them to behave—well, as the children of kings are little given to behaving; and they had found out now they were mere ordinary mortals, with only the same inherent and universal reasons for right and high action as the common herd of us. It was a sad come-down—for a royal Plantagenet.

The revulsion was terrible. And Maud, who was in some ways the prouder of the two, and to whom, as to most of her sex, the extrinsic reason

* Copyright 1892 in the United States of America by the Cassell Publishing Company.

for holding up her head in the midst of poverty and disgrace had ever been stronger and more cogent than the intrinsic one, felt it much the more keenly. To women, the social side of things is always uppermost. They journeyed home in a constant turmoil of unrelieved wretchedness; they were not, they had never been royal Plantagenets.

Just like all the rest of the world! mere ordinary people! And they, who had been sustained, under privations and shame, by the reflection that if every man had his right, Dick would have been sitting that day on the divided throne of half these islands! Descendants, after all, of a cobbler and a dancing-master! No Black Prince at all in their lineage! no Henry, no Edward, no Richard, no Lionel! *Cœur-de-Lion*, a pale shade! Lackland himself taken away from them! And how everybody would laugh when they came to know the truth. Though that was a small matter! It was no minor thing like this, but the downfall of a faith, the ruin of a principle, the break-up of a rule in life, that really counted!

There you have the Nemesis of every false idea, every unreal belief: when once it finally collapses, as collapse it needs must before the searching light of truth, it leaves us for a while feeble, uncertain, rudderless. So Dick felt that afternoon; so he felt for many a weary week of reconstruction afterwards.

At last they reached home. 'Twas a terrible home-coming. As they crept up the steps, poor dispossessed souls, they heard voices within, Mrs Plantagenet's, and Gillespie's, and the children's, and Mary Tudor's.

Dick opened the door in dead silence and entered. He was pale as a ghost. Maud walked stately behind him, scarcely able to raise her eyes to Archie Gillespie's face, but still proud at heart as ever. Dick sank down into a chair, the very picture of misery. Maud dropped into another without doing more than just stretch out one cold hand to Archie. Mrs Plantagenet surveyed them both with a motherly glance. 'Why, Dick,' she cried, rushing up to him, 'what's the matter? Has there been a railway accident?'

Dick glanced back at her with affection half masked by dismay. 'A railway accident!' he exclaimed with a groan. 'Oh, mother dear, I wish it had only been a railway accident! It was more like an earthquake. It's shaken Maud and me to the very foundations of our nature!' Then he looked up at her half pityingly; she wasn't a Plantagenet except by marriage; she never could quite feel as they did the sanct—And then he broke off suddenly, for he remembered with a rush that horrid, horrid truth. He blurted it out all at once: 'We are not, we never were, real royal Plantagenets!'

'I was afraid of that,' Mary Tudor said simply. 'That was just why I was so anxious dear Maud should go with you.'

Gillespie said nothing, but for the first time in public he tried to take Maud's hand for a moment in his. Maud drew it away quickly. 'No, Archie,' she said with a sigh, making no attempt at concealment. 'I can never, never give it to you now again. For to-day I know we've always been nobody.'

'You're what you always were to me,' Gillespie

answered in a low voice. 'It was you yourself I loved, Maud, not the imaginary honours of the Plantagenet family.'

'But I don't want to be loved so,' Maud cried, with all the bitterness of a wounded spirit. 'I don't want to be loved for myself. I don't want any one to love me—except as a Plantagenet!'

Dick was ready, in the depth of his despair and the blackness of his revulsion to tell out the whole truth, and spare them, as he thought, no circumstance of their degradation. 'Yes, we went to Framlingham princes and princesses; and more than that,' he said, almost proud to think whence and how far they had fallen; 'we return from it, beggars. I looked up the whole matter thoroughly, and there's no room for hope left, no possibility of error. The father of Giles Plantagenet, from whom we're all descended, most fatally descended, was one Richard—called Plantagenet, but really Muggins, a cobbler at Framlingham; the same man, you know, Mary, that I told you about the other day. In short, we're just cousins of the other Plantagenets—the false Plantagenets—the Sheffield Plantagenets—the people who left the money.'

He fired it off at them with explosive energy. Mary gave a little start. 'But surely in that case, Dick,' she cried, 'you must be entitled to their fortune! You told me one day it was left by will to the descendants and heirs-male of Richard Muggins, alias Plantagenet, whose second son George was the ancestor and founder of the Sheffield family.'

'So he was,' Dick answered dolefully, without a light in his eye. 'But, you see, I didn't then know, or suspect, or even think possible—what I now find to be the truth—the horrid, hateful truth—that our ancestor, Giles Plantagenet, whom I took to be the son of Geoffrey, the descendant of Lionel, Duke of Clarence, was in reality nothing more than the eldest son of this wretched man Richard Muggins; and the elder brother of George Muggins, alias Plantagenet, who was ancestor of the Sheffield people who left the money.'

'But if so,' Gillespie put in, 'then *you* must be the heirs of the Plantagenets who left the money, and must be entitled, as I understand, to something like a hundred and fifty or a hundred and sixty thousand pounds sterling!'

'Undoubtedly,' Dick answered in a tone of settled melancholy.

Gillespie positively laughed, in spite of himself, though Maud looked up at him through her tears and murmured, 'Oh, Archie, how can you?'

'Why, my dear fellow,' he said, taking Dick's arm, 'are you really quite sure it's so? Are you perfectly certain you've good legal proof of the identity of this man Giles with your own earliest ancestor, and of the descent of your family from the forefather of the Sheffield people?'

'I'm sorry to say,' Dick answered with profound dejection, 'there can't be a doubt left of it. It's too horribly certain. Hunting up these things is my trade, and I ought to know. I've made every link in the chain as certain as certainty. I have a positive entry for every step in the pedigree—not doubtful entries, unfortunately, but such conclusive entries as leave the personality of each person beyond the reach of

suspicion. Oh, it's a very bad business, a terrible business!' And he flung his arms on the table, and leaned over it himself, the very picture of mute misery.

'Then you believe the money's yours?' Gillespie persisted, half incredulous.

'Believe it!' Dick answered. 'I don't believe it; I know it is—the wretched stuff! There's no dodging plain facts. I can't get out of it anyhow.'

'Did you realise that this money would be yours when you saw the entries at Framlingham?' Gillespie inquired, hardly certain how to treat such incredible behaviour.

'I didn't think of it just at once,' Dick answered with profound despair in his voice; 'but it occurred to me in the train; and I thought how terrible to confess it before the whole world by claiming the wretched money. Though it might perhaps be some consolation, after all, to poor mother.'

'And you, Maud?' Gillespie inquired, turning round to his sweetheart and with difficulty repressing a smile. 'Did you think at all of it?'

'Well, I knew if we were really only false Plantagenets like the Sheffield people,' Maud answered bravely through the tears that struggled hard to fall, 'we should probably in the end come in to their money. But oh, Archie, it isn't the money Dick and I would care for. Let them take back their wealth: let them take it: if they will! But give us once more our own Plantagenet ancestry!'

Gillespie drew Mary aside for a moment. 'Say nothing to them about it for the present,' he whispered in her ear. 'Let the first keen agony of their regret pass over. I can understand their feeling. This myth had worn itself into the very warp and woof of their natures. It was their one great inheritance. The awakening is a terrible shock to them. All they thought themselves once, all they practically were for so many years together, they have suddenly ceased to be. This grief and despair must wear itself out. For the present we mustn't even inquire of them about the money.'

And indeed it was a week or two before Dick could muster up heart to go with Archie Gillespie to a lawyer about the matter. When he did, however, he had all the details of the genealogy, all the proofs of that crushing identification he had longed to avoid, so fully at his finger-ends, that the solicitor whom he consulted, and to whom he showed copies of the various documents in the case, hadn't a moment's doubt as to the result of his application. 'I suppose this will be a long job, though,' Gillespie suggested, 'and may want a lot of money to prosecute it to its end? It'll have to be taken for an indefinite time into Chancery, won't it?'

'Not at all,' the solicitor answered. 'It's very plain sailing. We can get it through at once. There's no hitch in the evidence. You see, it isn't as if there were any opposition to the claim, any other descendants. There are none, and by the very nature of the case there can't be any. Mr Plantagenet has anticipated and accounted for every possible objection. The thing's as clear as mud. His official experience has enabled him to avoid all the manifold pitfalls of amateur

genealogists. I never saw an inheritance that went so far back made more absolutely certain.'

Poor Dick's heart sank within him. He knew it himself already; but still, he had cherished throughout some vague shadow of a hope that the lawyer might discover some faint flaw in the evidence which, as he considered, had disinherited him. There was nothing for it now but to pocket at once the Plantagenet pride and the Plantagenet thousands—to descend from his lofty pedestal and be even as the rest of us are—except for the fortune. He turned to Gillespie with a sigh. 'I was afraid of this,' he said. 'I expected that answer. Well, well, it'll make my dear mother happy; and it'll at least enable me to go back again to Oxford.'

That last consideration was indeed in Maud's eyes the one saving grace of an otherwise hopeless and intolerable situation. Gradually, bit by bit, though it was a very hard struggle, they reconciled themselves to their altered position. The case was prepared, and as their lawyer had anticipated, went straight through the courts with little or no difficulty, thanks to Dick's admirable working up of all the details of the pedigree. By the time eight months were out, Dick had come into the inheritance of 'the Plantagenets who left the money,' and was even beginning to feel more reconciled in his heart to the course of events which had robbed him so ruthlessly of his fancied dignity, but considerably added to his solid comfort.

Before Dick returned to Oxford, however, to finish his sadly-interrupted university career, he had arranged with Mary that as soon as he took his degree, they two should marry. As for poor Maud, woman that she was, the loss of that royal ancestry that had never been hers seemed to weigh upon her even more than it weighed upon her brother. The one point that consoled her under this crushing blow was the fact that Archie, for whose sake she had minded it most at first, appeared to care very little indeed whether the earliest traceable ancestor of the girl he loved had been a royal Plantagenet or a shoe-making Muggins. It was herself he wanted, he said with provoking persistence, not her great-great-grandfathers. Maud could hardly understand such a feeling herself; for when Archie first took a fancy to her, she was sure it must have been her name and her distinguished pedigree that led an Oxford man and a gentleman, with means and position, to see her real good points through the poor dress and pale face of the country dancing-master's daughter. Still, if Archie thought otherwise—Well, as things had turned out, she was really glad; though, to be sure, she always felt in her heart he didn't attach quite enough importance to the pure Plantagenet pedigree that never was theirs, but that somehow ought to have been. However, with her share of that hateful Sheffield money, she was now a lady, she said—Archie strenuously denied she could ever have been anything else, though Maud shook her head sadly—and when Archie one day showed her the photograph of a very pretty place among the Campsie Fells which his father had just bought for him, 'in case of contingencies,' and asked her whether she fancied she could ever be happy there, Maud rose with tears in her eyes and laid her hand in his, and

answered earnestly: 'With you, dearest Archie, I'm sure I could be happy, my life long, anywhere.'

And from that day forth she never spoke to him again of the vanished glories of the Plantagenet pedigree.

Perhaps it was as well they had believed in it once. That strange myth had kept them safe from sinking in the quicksands when the danger was greatest. It had enabled them to endure, and outlive with honour, much painful humiliation. It had been an influence for good in moulding their characters. But its work was done now, and 'twas best it should go. Slowly Dick and Maud began to realise that themselves. And the traces it left upon them, after the first poignant sense of loss and shame had worn off, were all for the bettering of their moral natures.

THE END.

SOME CURIOSITIES OF THE ORDERLY-ROOM.

OUR soldiers in former days had many duties to perform, which, since the establishment of the new Metropolitan Police Force in 1829, have been generally relegated to the province of the blue-coated guardians of the peace; hence various orders issued from time to time to the regiments of Guards quartered in London—more especially the Foot-guards—throw some curious side-lights on the manners and customs of over a century.

Of the forces which had been raised during the Civil War, Charles II. was permitted by Parliament at the Restoration to retain certain regiments as a royal guard—a body destined to form the nucleus of our standing army. Some of these were called 'Coldstreamers,' after the Berwickshire town where Monk raised them in 1660. The term 'Grenadier' was not in the first instance applied exclusively to a particular body of men, for every regiment contained a certain proportion of grenadiers. Evelyn, in a note in his Diary for 1678, mentions their introduction as follows. 'Now,' he tells us, 'were brought into service a new sort of soldiers called Grenadiers, who were dextrous in flinging hand-grenades, every one having a pouch full; they had furred cappes with coped crownes like Janizaries, which made them look very fierce; and some had long hoods hanging down behind, as we picture fools, their clothing being likewise pybald yellow and red.'

The Royal Regiment of Guards was first raised by Charles II. in Flanders in 1656; and another regiment was combined with it under Colonel John Russell in 1665. Civil duties of a most varied kind fell to the lot of the new Guards. In 1676 we find a sum of twenty-five pounds being granted to one hundred and ninety-one inferior officers and men drawn from both regiments of Foot-guards, as a compensation for losses incurred in an extensive fire which took place at Southwark in that year. The soldiers had given effective assistance in preventing the spreading of the conflagration, and no doubt their clothing and arms had been greatly injured or destroyed. Fire-engines with hose-pipes are said to have

been first used at this fire. A few years previously—about 1657—a fire-engine had been constructed by Hautsch of Nuremberg, and the flexible hose was introduced in 1672 by a Dutchman named Vanderheide. The fire-insurance companies of London had each a separate establishment of fire-engines until 1825, when several of the foremost companies united their establishments, and a few years later the first Fire Brigade was formed.

In 1667 the Life-guard was sent on a curious and destructive errand—not to quell an insurrection, as was believed in Samuel Pepys's circle, but to destroy a flourishing crop of tobacco at Winchcombe, 'which it seems the people there do plant contrary to law.' It is said that tobacco was first cultivated in this Gloucestershire parish of Winchcombe St Peter after its introduction into England in 1583, proving a considerable source of profit to the inhabitants, till the trade was placed under restrictions.

The origin of the 'Sergeant's Guard' attending during the performances at royal theatres can be traced back to 1672, in which year a royal command was issued to the Foot-guards 'to send a careful officer with such number of soldiers as you shall think reasonable to the theatre in Dorset Gardens, to keep the peace there at and about the time of public demonstrations, so that no affront may be given to the spectators nor no affront to the actors.' The theatre at Dorset Gardens stood fronting the river in Fleet Street, on the east side of Salisbury Court, and hither the 'Duke's Company' of actors removed from Lincoln's Inn Fields in 1671. The theatre was still standing in the year 1720, but appears to have been pulled down shortly after that date.

In 1721, Rich—famous as the introducer of pantomime on the English stage—obtained leave for a party of the Guard to do duty at his theatre in Lincoln's Inn Fields in a similar way. The necessity for military aid arose out of a disturbance which had been brought about by a dispute between a certain Earl and the manager Rich. The Earl, it seems, during a performance of the *Beggar's Opera*, being behind the scenes, crossed over the stage to some friends of his on the other side amid the hisses of the audience. An altercation was followed by blows, and a rather serious riot was the outcome of this storm in a teacup. King George I., on hearing of the affair, ordered a guard to attend there in future.

Again, in 1725, we find an order that at a ball given at the theatre in the Haymarket, one hundred privates under a captain were to attend, and were 'not to permit any person to enter into the said theatre in habits that may tend to the drawing down reflections upon religion or in ridicule of the same.' The theatre above referred to was built by Vanbrugh in 1705, but was burnt down in 1789.

The English have never taken very kindly to the masqued ball—a masquerade given by Henrietta, the queen of Charles I., on a Sunday having indeed caused a riot. The most splendid affair of the kind, however, took place at the Opera House in 1717, and was provided by the celebrated Mr Heidegger. In 1724, these entertainments were preached against by no less an authority than the Bishop of London; and in

1729 the Grand Jury of Middlesex 'presented the fashionable and wicked diversion called masquerade, and particularly the contriver and carrier-on of masquerades at the King's Theatre in the Haymarket, in order to be punished according to law.'

Turning to the Jacobite rising of 1715, we find the following curious entry in the records of the Coldstream Guards: 'June 10th, 1715. The Guards were posted in different parts of London to prevent persons wearing white roses.' We do not hear whether a similar order was issued against the custom of wearing patches as political emblems: one side of the face signifying Whig, the other, Tory principles. Adherents of the Stuarts were also known by wearing white ribbons; while certain ladies at Bath, who hesitated to commit themselves, wore the colours of both parties, and won for themselves the name of 'trimmers.'

The state of feeling at the death of Queen Anne is well shown by an incident which took place in April 1714. A review had been ordered to take place in Hyde Park on the 17th of the month; but the new clothing of the First Regiment of Footguards was not delivered till the preceding evening; and in the hurry, the officers failed to examine it, and it turned out that some articles of the clothing, especially the shirts, were so coarse that the soldiers considered they had been cheated, and some insubordination ensued. The detachment marching to the Tower carried their shirts in their hands, exhibiting them to the shopkeepers, saying: 'These are Hanover shirts.' The Duke of Marlborough, however, took immediate steps to remedy these defects; and it is satisfactory to learn that the affair ended by the soldiers all drinking the king's health.

About this time the pay of a soldier in the Foot-guards was twopence per diem, being twopence more than that of the ordinary foot-soldier. Out of this, however, considerable deductions were made. The Colonel provided the clothing; while arms and armour—with the exception of swords—were found by the State. The Colonels' clothing system, which was open to many objections, nevertheless survived till after the Crimean War in 1854.

In connection with costume, a curious order was issued in 1735 that the officers of the Coldstream Guards were to appear 'on Tuesday next as at a review,' and were to have on 'twisted ramified wigs, according to the pattern which may be seen at the Tilt Yard to-morrow.' This probably refers to the long gradually-diminishing plait to the wig, with a great bow at the top, and a smaller one at the bottom, which were styled 'Ramilie' after the battle fought in 1706. At a review by Lord Scarborough in 1735 the Guards were ordered to appear with 'their coats pulled down so as to sit well and even, their hats to be well put on, and their hair tucked under, for no man will be suffered to wear a wig unless it is so like a head of hair as not to be perceived.' In 1746, again, 'no soldier will be permitted to wear a wig after the 25th of March next;' and in 1747 it was ordered that 'officers for the future do always mount guard in queue wigs or their own hair done in the same manner;' and soldiers 'who cannot wear their hair through age or infirmity are to provide

themselves with wigs made to turn up like the hair, which they are to wear on mounting days.'

An amusing order, in July 1736, directs the men 'to appear perfectly clean and shaved, square-toed shoes, gaiters, their hats well cocked, and worn so low as to cover their foreheads, and raised behind, with their hair tucked well under and powdered, but none on their shoulders, the point of their hats pointing a little to the left;' and so forth.

In 1823 trousers were introduced and breeches discontinued throughout the British infantry, as well as shoes and leggings. The new trousers were made of bluish-gray cloth, and half-boots were now worn. In April 1736, an order—in which the spelling is rather defective—directs that 'no sentinel is on any account to quit his arms nor suffer any bench, chair, stone, or seat whatsoever to be in his centry-box, nor drink or smoke on his post, nor wear a nightcap when centry, but his hair under his hat, and everything in good order.'

A certain nervousness as to the state of the Guards' apparel is evident in an order issued in July 1737: 'Particular care to be taken that the Hampton Court party on Monday morning have good blue breeches on, because their clothes are to be looped up.' A severe disciplinarian seems to have been in command of the Grenadiers in 1735, judging from an order issued in October of that year that 'any soldier that comes to the parade with two shirts on, brings any necks [*sic*] in his pocket or pouch, or changes his linen on guard, shall receive one hundred lashes on the next mounting day.'

The last century was distinguished by numerous riots and disturbances of various kinds, and the services of the Guards were often needed. It is from several orders issued in 1732 that the custom of placing sentries at the different Government offices seems to have arisen, the early months of that year having witnessed numerous street disturbances. In April 1733 a letter was addressed by the Secretary-at-War to the officer in command of the Foot-guards at the Tower, directing him to assist the Commissioner of Customs in securing all contraband goods; which is of interest, as showing the difficulty of enforcing the payment of duty, and the prevalence of smuggling at this period. The port of London was calculated to lose about one hundred thousand pounds a year in this manner. The Report of Sir John's Cope's Committee of the House of Commons in 1732 contains some very astounding facts and figures. In the nine years before that date, two hundred and fifty Custom-house officers had been beaten and otherwise ill-treated; while six had been murdered. The number of prosecutions had been upwards of two thousand. The Report went on to state that the smugglers had 'grown to such a degree of insolence as to carry on their wicked practices by force and violence not only in the country and remote parts of the kingdom, but even in the City of London itself, going in gangs armed with swords, pistols, and other weapons, even to the number of forty or fifty, by which means they have been too strong not only for the officers of the revenue but for the civil magistrates themselves;' and so forth.

The definition of Excise in Dr Johnson's Dictionary as a 'hateful tax' would seem to have

commended itself to very many persons at this period. In November 1750 the three regiments of Guards were required to find detachments to be in readiness to assist the civil authorities in resisting any attempts to rescue some outlawed smugglers then prisoners in Newgate, as intelligence had been received by the Government that a number of desperate men, also smugglers, had set out from Norfolk and Suffolk with a view to releasing their comrades.

A curious order to the Grenadier Guards in August 1725 directed 'a detachment of sixty-four men under a lieutenant and ensign to March to Barnet and be assisting in seizing and securing the deer-stealers who infest the Chase of Enfield and carry away the deer'—an offence by no means uncommon at this period. White, in his *Natural History of Selborne*, tells us that 'towards the beginning of this century all this country [Hampshire] was wild about deer-stealing. The "Waltham Blacks" at length committed such enormities that Government was forced to interfere with that severe and sanguinary Act called the Black Act [1723], which comprehended more felonies than any law that was ever framed before.'

The state bordering on frenzy to which many speculators in the South Sea scheme had been reduced on the bursting of the bubble in 1720, accounts for an order issued in 1722 'that the Tower Guard should at any time afford aid and assistance whenever required by the Directors of the Bank, the South Sea or the India Company.' The Bank of England—founded in 1694—was at this time only feeling its way to public confidence, and its business was carried on not in the magnificent pile of buildings we now associate with its name, but in Grocers' Hall, in the Poultry. The desolate condition of the South Sea House in his day is well described by Charles Lamb.

An order issued in October 1745 gives a good idea of our old constitutional force and its decay at this period: 'If the militia are reviewed to-morrow by His Majesty, the soldiers of the three regiments of Guards are to behave civilly, and not to laugh or make any game of them.' The militia had been much neglected during the era of Marlborough's victories, very few musters except in the City of London having taken place. Dryden rather maliciously referred to the force as

In peace, a charge; in war, a weak defence;
Stout once a month they march a blustering band,
And ever but in time of need at hand—

the sentiment contained in the last line having been since frequently applied to other guardians of the peace! At the accession of George III. it was raised by lot or ballot of persons eligible in all the counties of England, and whoever was drawn was compelled to serve in person or by substitute for a given term. In May 1763 a detachment of Guards was quartered in Spitalfields, on account of the frequent disturbances brought about by the weavers, who were aggrieved by the introduction of French silks into this country. These riots continued at different intervals for several years, and much consternation was caused by companies of weavers patrolling the streets disguised as sailors and armed with

cutlasses. The efficiency of the modern police force has rendered the employment of military in civil disturbances very rarely necessary.

In conclusion, a word may be said about the Cato Street Conspiracy against the ministry in 1820, when a party of Coldstreams was ordered to assist the Bow Street officers in the capture of the conspirators, which was effected, after a desperate resistance, in the stable in the street off the Edgware Road once called Cato, and afterwards rejoicing in the equally classical name of Homer! The ringleader, Arthur Thistlewood, was the last person committed as a prisoner to the Tower.

THE IRONY OF FATE.

CHAPTER VI.—LORD CRANSFORD.

SOME weeks have elapsed since the events related in the last chapter occurred, and the time for Arabella's departure was at hand. Everything had been arranged. Miss Mortimer, kind good soul that she is, had taken her departure, she having gone to reside with a lady at Eastbourne. Netley Lodge is let, and the incoming tenant is expected to take possession in a few days. The Misses Scudamore and the rest of the gossips were in a state of anxiety to discover who the newcomers were and what Major Bowyer had to say to Arabella's engagement. With regard to the first, Arabella either would not or could not, at any rate she did not choose to gratify their curiosity; and as to the latter, when Miss Nugent ventured to hint at her anxiety on this point, she got such a rebuff that no one else had ventured to seek for further information.

The lovers looked forward to their separation with something like dismay. Up to this point, her guardian had placed no obstacle in the way of their meeting. He did not want a scene; he saw that Arabella was a girl to be led, not driven, and he therefore determined to bide his time.

As the day drew near for their departure, the Major opened the ball by suggesting that before proceeding to Devonshire they should break the journey by a short stay in London, so as to give Arabella an opportunity of seeing something of London and London life. But Bella refused the offer point-blank. She did not feel, suffering as she was from the recent loss of her kind father, equal to entering into London society, and preferred, if her uncle did not object, to defer her visit to a more convenient season.

'Of course, if you prefer it, my dear, we will go right through; but I should like to have been able to introduce you to my friend, Lord Cransford.'

'Who is Lord Cransford?' asked Bella. 'I never heard you mention him before.'

'Perhaps not. He is quite a young man; but he is very nice, and is a dear friend of mine, and I should like you to know him.'

'My acquaintance with lords and members of the aristocracy is not very extensive,' replied Bella gravely; 'but as far as it has gone, I don't think they possessed a very high order of intel-

lect; and were rather proud and stuck-up. Of course, as I was an heiress, they were very civil and condescending to me, and one or two had the temerity to ask me to marry them; but I very soon gave them their *congé*. I could never stoop so low as to marry a man for his title; and as far as my experience goes, that was the only recommendation they possessed.

The Major smiled sarcastically, saying: 'Your experience must be either very limited, or your introducers unfortunate. But, my dear Bella, is it possible—do I understand you aright—that you had offers of marriage from members of the aristocracy, and refused them?'

'Certainly. Do you think I would marry a man simply because he was a lord?'

'I suppose not. But what did your father say to this?'

'Oh, pappy! poor old dear, he only laughed, and said I was a strange little girl; but that, as he did not want to get rid of me, it was all right.'

'But surely, child,' insinuated the Major, 'it was rather thoughtless of you to throw such a chance away.'

'Not at all. Why, my Frank is worth half-a-dozen of such nincompoops!'

'I wish you would not talk about Mr Wallis in that way,' he said testily; 'I strongly object to it.'

'Oh, I can't help that; you will have to get over it. He is my Frank, you know; and he says he never was in love till he saw me!'

'My dear girl, this is all childish nonsense! You are too young to marry, and too inexperienced to know what is good for you. You must remember that you are my ward, and that it is your duty to obey me.'

'Yes, I know all about that. I'm quite willing to obey you; but you must not try to thwart me. Papa never did, and I know if you were to try, I should rebel at once.'

For a few minutes there was silence in the room. Then Bella asked: 'What sort of a man is this Lord Cransford?'

'Young, and very handsome.'

'Yes, yes; I know all about that. He's got a head, of course; but is there anything in it?'

'Well, I should say there was—he knows a thing or two.'

'That is, I suppose, he can play at poker, *écarté*, and billiards?'

'Yes, most probably; and lawn-tennis and cricket.'

'Quite an accomplished gentleman, I suppose. Can he dance?'

'Yes, he is a splendid waltzer,' replied the Major.

'Ah!' she mused, 'does he ever read?'

'Yes; he's a great reader, especially of newspapers; he takes in *Bell's Life* and the *Era*.'

'A sportsman and a patron of the drama. Ever do anything in the way of amateur theatricals?'

'No; I think not.'

'Ah! that's a pity.—Where does he live?'

'He has chambers in the Albany.'

'Yes, yes; but his country seats?'

'Well, you see, he is the nephew of the Duke of Falmouth, and he does not come into his estates till his uncle's death.'

'Are they poor?'

'No; the Duke's estates are very large.'

'That goes for nothing; they may be mortgaged up to the hilt, as papa used to say.'

'I know nothing about that,' replied Major Bowyer. 'I never inquire into the private affairs of my friends.'

At this moment the door opened, and James announced: 'A man from Mr Blackburn to see you, sir.'

'All right, James; I'll be with him immediately.'

The Major left the room, and almost at the same moment the bell rang again, and Lieutenant Wallis was announced.

'Oh, Frank!' cried Bella, rushing forward and putting her arms round his neck, 'I'm so glad you have come. I want to talk to you. I'll fetch my hat and cloak, and we'll go out into the garden.—You don't object, do you, dear?'

'No, my sweet Bella,' he replied, still holding the hand she had placed in his. 'Let us go at once.'

So Bella ran for her hat and cloak, and they went out into the shrubbery. As soon as they were clear of the house, Bella commenced: 'I think uncle's let the cat out of the bag at last, Frank. I told you I knew he'd got some scheme in his head to make me a lord's wife; and now it's come out. I'm to be Lady Cransford!'

'Lady Cransford!' he iterated.

'Yes; I'm to marry Lord Cransford.'

'Lord Cransford!' he repeated. 'Is it possible your uncle could be so base?'

'Base! Why, what's the matter with Lord Cransford?'

'He's a man no respectable girl ought to associate with. He's a *roué*, a gambler, and a blackleg; in short, a thorough blackguard!'

'Good gracious!' exclaimed Arabella. 'Why, my uncle speaks so highly of him. "An accomplished gentleman" was the phrase he used.'

'Yes; that's quite true in a certain sense. He is handsome, tall; with elegant manners, and a soft melodious voice; but if he possesses any heart at all, it must be a black one. I should say there are few crimes, short of murder, that he has not committed.'

'How came you to know so much about him?'

'He is my cousin.'

'Frank!' she exclaimed incredulously, 'is it possible? You cousin to a lord?'

'Yes, dearest; only, as we were poor, my mother dropped her title, and thinks it best not to talk about our rich and titled relations.—But now, dear, I must get you to keep this a secret. My mother would be greatly annoyed if it was known in Nunsford.'

'You may depend on me, dear; wild horses should not drag the secret from me,' replied Arabella.

'I trust you implicitly, darling,' he said softly; and then, after a pause: 'I don't like the outlook; I'm afraid you will have a hard battle to fight.'

'I know that, dear. I know now that my uncle will do all he can to prevent our marriage; but we must trust in God's good providence to help us.'

'Yes, darling; and I think He will,' responded

Frank. 'If anything was to happen to separate us, I don't think I could exist.'

'Nothing but death shall, dear!' she replied earnestly. 'I don't expect the next two years will be very happy ones for me; but we must hope for the best.'

CHAPTER VII.—FOILED.

Winter had come and gone, and spring was verging into summer. There was music in the air, the hum of bees, and the joyous song of the lark; and loveliness was spread over the earth like a mantle.

Arabella, in her little cosy boudoir, sits gazing out at the beautiful Devonshire landscape which spreads itself before her. All Nature was rejoicing; but the beauty of the scene and the melodious harmony of the bees and birds brought no joy to her heart. She was sad and lonely, everything was so different now from what it was when her dear father was alive. Major Bowyer was polite and amiable, or rather tried to appear so; but Arabella knew full well that it was a mere cloak to cover some more important and ulterior design. She had many causes of anxiety, but the chief one was that for some weeks past she had received no letters from Frank. He had got his promotion, and had joined his ship in the Mediterranean. He had promised to write immediately he reached Malta; but no letters had arrived. The question she was now debating was, had Frank really not written, or had his letters been intercepted? Another source of annoyance was that her uncle's visitors were mostly of the masculine gender; and the neighbouring gentry, especially of the softer sex, seemed to give her and Clumber Park as wide a berth as possible.

How she longed to get back to Nunsford; how she pined for a sight of good Miss Puddicombe and gentle Mrs Wallis! Even the Misses Scudamore would have been a welcome interruption to the monotony of Clumber Park.

A much more lively and very different scene was taking place in the Major's study.

'It's no use, my friend,' said Lord Cransford; 'the girl's as obstinate as a mule; and, unless you can speedily alter the state of things, I shall cut the business, and you'll have to get another customer for your heiress.'

'Hush! hush!' said the Major softly; 'if any one was to hear you!'

'What do I care if they did!'

'That's true enough; but I do. You are too hasty, my friend, as you will see. You are not going about the business in the right way.'

'Now, that's just like you, Bowyer, trying to throw the blame on my shoulders,' exclaimed Lord Cransford. 'You have deceived me, and so has she. I thought the whole thing was settled, or at least understood, and that all I had to do was to go in and win; and now she laughs at me, and refuses me point-blank.'

'You are too hasty, my friend,' said the Major. 'You have not had so much experience of the sex as I have. You expected that she would leap into your arms and weep tears of joy and exultation. But that's not the way with young ladies of the present day.'

'It's all very well to talk in that way,' replied Lord Cransford; 'but I believe she means what

she says, and that, unless you can put the screw on, the game is all up!'

'Well, then, my friend,' said the Major coolly, 'we shall put the screw on, and, if necessary, pretty sharply; but I don't think it will be necessary. This is only a bit of romantic affectation. I'll have a talk with her in the morning, and I pledge you my honour that to-morrow you will meet with a very different reception.'

The following morning, shortly after breakfast, Arabella received a peremptory message from Major Bowyer to say he wanted her in his study immediately.

'Tell Major Bowyer I will be with him in half-an-hour,' she replied. 'I'm busy now;' and the servant departed.

'Don't you think you had better go as soon as you can?' suggested Mrs Manser. 'He was as cross as two sticks at breakfast, and a little compliance would mollify him.'

'But I don't want to; I want to make him in a rage. I'm going to be as cool as a cucumber; and the more angry he is, the more advantage I shall have over him.'

At this moment Thomas re-entered the room. 'If you please, miss,' he said, 'master says he can't wait, and he desires me to say that you must come at once.'

'Oh, that's all nonsense!' replied Arabella.

'Yes, miss, I daresay it is; but I can't go and tell master that.'

'No, Thomas; of course you can't,' replied Arabella with a pleasant smile. 'You can, however, give my compliments to Major Bowyer, and say that, as I find it impossible to be in two places at once, and as I have some letters to write, I see no other alternative but that I should defer my interview with him till a more convenient season.'

Thomas bowed, and was about to depart, when Arabella continued: 'Don't bring me any more messages, because you interrupt me, and I want to send off my letters by the next post.'

With a broad grin on his usually stolid countenance, the footman proceeded to the study and delivered his message verbatim, and was thereupon told to pay a visit to his satanic majesty, to which Thomas replied, 'Yessur,' and retired.

Major Bowyer was a man who usually had his temper well under command; but this defiance of his authority was almost more than he could bear; and he walked up and down the study grinding his teeth and vowing vengeance against his ward, and muttering incoherent ejaculations, of which only a portion was intelligible, such as 'Cursed impertinence!' 'Impudent young hussy!' 'Wants to ride her high-horse, hey? Well, mind you don't come a cropper;' and so forth.

At the end of half an hour Arabella made her appearance, and her smiling face and laughing eyes formed a strong contrast to the scowling brows and angry face of her uncle.

'I'm so sorry I could not come before, my dear uncle,' she said blandly; 'but you see you choose such inconvenient times for your interviews.—And now, what is it you have to say?' and she laughed a little irritating laugh.

'I must beg of you to be more serious, Miss Alsworth,' said the Major excitedly, 'for what I have to say affects your future happiness as

well as mine.—Take a seat ;' and he motioned her to a chair. 'Lord Cransford has made you an offer of marriage. Such an alliance would be advantageous to both you and me in every way. It would give you a title and the *entrée* into society ; and as to me, well, my interest in the matter is small. I have considered the whole matter temperately and calmly, and have formed my resolution simply under a consideration of your happiness and welfare, which, as your guardian and trustee, I think it my duty to take. I have come to this conclusion after full and calm reflection, and not all the tears and prayers in the world shall move me. I know it is for your good ; I know it is my duty to be determined—and I am determined. You must marry Lord Cransford !' He kept his eyes steadily fixed on her face as he said this ; he seemed to have imagined that this declaration would have been followed by prayers, tears, or declamation ; but Arabella was perfectly silent. She was a little pale—that was all the emotion she displayed.

'I am prepared,' he went on, 'to be accused of the most unparalleled cruelty in thus forcing your inclination and using the power I possess in obliging you to accept this proposal, which the whole world will consider, in your situation, a most fortunate one ; and I should despise myself if, in a moment of weakness, I held out any alternative which might lead you to hesitate as to the acceptance of it.'

'Hesitate !' she cried in mocking tones, as she rose up and faced him. 'No ; I shall not hesitate for a moment. I distinctly and absolutely refuse Lord Cransford's offer of marriage. I should despise myself if I for one moment hesitated to give up the man I love for such a creature as he is !'

For a moment or two the Major stared at her as one petrified. Was this chit of a girl to set him at defiance ? He sat fixed in his chair. His amazement was so great he could hardly realise the situation. He had pictured her throwing herself at his feet and weeping and beseeching him to spare her ; and instead, she was standing before him defying him to his face.

'Have you anything more to say ?' she asked.

'Only that you shall marry Lord Cransford !' he repeated.

'I will not !' she answered firmly ; 'no earthly power shall make me !'

'You may struggle,' he said harshly ; 'but you will find it is vain to resist. Go to your room, and don't leave it till I send for you.'

'Go to my room ! What for ?'

'Because I command you to do so.'

'But suppose I refuse. What then ?'

He rose up and assumed a menacing attitude, and roared : 'Leave the room, girl !'

'We are not in Turkey,' she said calmly, 'and you are not the Great Mogul.'

'Will you leave the room !' he exclaimed, advancing towards her. 'I am your guardian, and I command you to retire to your room.'

'Don't be silly ; I shall not leave the room till I choose,' she exclaimed with a laugh. 'If you want me to go, you must speak more politely. You should say : "My dear niece, you have upset my beautiful little matrimonial scheme, and I

am in a most disagreeable humour ; will you kindly leave the room, and not make your appearance again till I send for you ?"'

Major Bowyer retreated to his chair, and sat and scowled at her.

'Won't you say it ?' she asked quietly.

Not a word came from the Major's lips, but he sat biting them savagely.

'Well, if that will not suit you, I'll try you on the other tack. Command me to sit down, and not leave the room on peril of your displeasure, and I will at once relieve you of my presence.'

There was a pause, and then she continued : 'You are hard to please. Won't either of these courses suit you ? Well, then, I'll go ; not to please you, but myself ;' and she walked calmly across the floor and closed the door quietly after her.

Major Bowyer sat silently pondering over this strange and unexpected termination of the interview with his ward, for which he had so sedulously prepared himself. What was he to do now ? was the question he asked himself, but was unable to answer.

Meantime, Arabella had flown up-stairs to her room, and closed and locked the door, and sat down to think. Thus far, the victory had been on her side ; she had repulsed the enemy ; but would he not return to the attack ? There was one thing she was glad of, and that was that her uncle had shown his hand : he intended, if he could, to force her to marry Lord Cransford. She knew nothing about the law, and she wondered if he had the power to compel her to marry whether she would or not. She was only a weak girl ; she was alone and almost friendless ; but her heart was strong and her spirit unbroken. No law, no compulsion should compel her to go to the altar and bind herself to a man like Lord Cransford.

SHOES AND SHOEMAKERS.

Boots and shoes are such prosaic things nowadays that it would be unreasonable to suppose them interesting ; and yet they have as quaint a history as any part of fashion's fabric. They were not always the factory-made articles which dangle pitifully in ungainly attitudes at the shop doors, and fit more or less clumsily the feet of the people we pass every day. They are rarely even pretty now, except it be in the dainty forms fashioned by artists in leather for the nightly decking of light fantastic toes ; and their general aspect is one of commonplace sameness. Yet once upon a time, in the ruffling days of the Merry Monarch, there were gallants who turned their high top-boots down to their ankles that they might reveal the costly laces with which they were lined. And earlier by a hundred years or so there were Walter Raleigh and other gay wights who promenade in diamond-studded shoes worth eighty thousand pounds. So gorgeous was the footgear of the times gone by that they put a king in a difficulty. When Charles VII. ascended the throne of France, so impoverished was his exchequer that he was actually at a loss to find a subject who would supply him with the magnifi-

cent coronation boots which all precedent required should be of white satin lavishly embroidered with gold lilies. Even the red deerskin brogues which the hardy Highlander carved out of the newly-slain deer and lashed round his calves with the hair outwards were more interesting than the shoes of to-day, for he made them himself, and their very uncouthness was full of suggestion.

Tight boots have troubled the world ever since it wore leather; but it is fortunate for the shoemakers that the author of the misery of toe-pinching is not always treated as he was once in Spain. The story goes that the bootmaker to Don Carlos, the son of Philip II., took him a pair of boots which were too small to be comfortable, and by the order of the angry Prince they were cut in pieces, boiled, and forced down the wretched fellow's throat, so that he was well-nigh killed. It was something rather worse than a tight shoe which Don John of Austria wore; it was, says the legend, a pair of shoes the soles and leather of which had been impregnated with poison; and after he wore them he died.

A curious investigation of the shoe-history of Napoleon Bonaparte has been made. It is assumed that in his boyhood he was careless as to his garments, and therefore as to his shoes. But when he became a Lieutenant of artillery he wore boots of soft black leather reaching to the knee. Having advanced to the rank of Captain, he donned boots 'à la Souvoroff,' which resembled hessians; but from the time when he became Brigade General, right through to the end of his First Consulship, he was addicted to top-boots. As Emperor, however, he wore long boots such as those used by Life Guardsmen; and to these he remained faithful throughout the duration of the Empire. Now the pathos of the history begins. When the poor fallen Emperor lived in St Helena he drew up with his own hand an inventory of his wardrobe; and all that remained to him out of his greatness was half-a-dozen of shirts, the like number of handkerchiefs, six pairs of silk stockings, two hats, two pairs of cambric sheets, two pairs of boots, and two of slippers. One pair of boots was placed on his body and buried with him; and when his remains were exhumed in 1840, it was found that though the thread with which the boots were sewn had decayed, and the bones of the feet peered mournfully between the soles and the uppers, yet the good leather remained as tough and stout as ever. And there is the less reason to wonder at this, in the opinion of the investigators, for Napoleon during the long period of fourteen years had his boots from only one tradesman, a Pole, who kept a shop in the Palais-Royal, and who preserved a set of his Imperial patron's lasts, on which he had inscribed, with quaint devotion, every one of his famous victories.

Of the lore and associations of boots and shoes there is practically no end. Nursery legend has endowed them with marvellous qualities of speed. Jack the Giant-killer's shoes of swiftness and the great monster's seven-leagued boots were gear that a man might sigh for when pressing circumstances taught him the discreeter part of valour. But these are frank falsehoods; even in the nursery they are fiction. Not so with some of the superstitions which tradition has laced around

shoes. It was unlucky, for instance, to put on the left shoe first, and when Augustus Cæsar did that one day, he narrowly escaped assassination. Under the old regime, when Japanese friends met in the streets they took off their shoes, and this notion prevails almost universally in the East. A shoeless foot betokens servitude, humility, and respect. Shoes are left at the door of the mosque when the worshipper enters; and if a friend calls on another, his shoes await him on the door-mat.

That appalling habit of throwing old shoes at weddings has several derivations. One theory is, that the shoe is thrown because it is a lucky instrument in its old age. Another is, that the custom is a relic of the period when the bride was taken by force, and that the discharge of these missiles is all that remains of the old combat. A third is, that the Anglo-Saxon father gave the bride's shoe to her husband, who touched her on the head with it as a sign of his authority, and that the throwing of the shoe indicates the parental resignation of all claims on the bride's obedience. Yet in Turkey the groom is the one most affected, for the moment he is married his good friends set upon him and beat him soundly with slippers as a sign of their affection. The Jews sealed a bargain by plucking off the shoe, as it is written in the verse, 'For to confirm all things a man plucked off his shoe and gave it to his neighbour; and this was a testimony in Israel.' The origin of the common saying about the hidden spot where the shoe pinches is ascribed to a Roman citizen who was divorced from his wife, though he had always seemed to live happily. When he was questioned by his friends, he put out his shoe to them. 'Is it not new and well-made?' he said; 'yet none of you can tell where it pinches.'

There is nothing new about high heels; they are as old as Hamlet's time at least. The melancholy Prince addresses the lady player: 'Your ladyship is nearer heaven than when I saw you last by the altitude of a chopine;' and a chopine was only a high heel which the fair ladies of old used to increase their stature.

The men who make these harmless necessary portions of our attire form one of the most remarkable classes of artisans. 'How is it,' said Sir Robert Peel once to a deputation of working men, the leaders of which were both shoemakers—'how is it that you shoemakers are foremost in every movement? If there is a plot, or conspiracy, or revolution, or political agitation, I find always that there is a shoemaker in the fray.' The answer to this pointed inquiry is not recorded; but there is no doubt that the intellectual activity of shoemakers is, or it may be fairer to say, was greater than that of any other body of workmen. This was more noticeable, it may be, fifty or a hundred years ago, before education was so generally diffused as it now is. Then they were recognised as singularly advanced in shrewdness, power of argument, and logical deduction, and in thoughtfulness. Their mental vigour took them into tangled fields of speculation, and led them to study their national literature with exceptional assiduity. Local preachers, class leaders, and eloquent advocates many of them were; strenuous political partisans, and agitators for many reforms; and often their meditations led them also into theo-

logical highways and byways, where their method of travelling was not of the orthodox kind. They seemed to beat out their theories as they beat out their leather; and every nail they drove into the sole of a shoe was as a stroke driven home in the process of mental construction.

Novelists and poets have been prone to people their works with shoemakers. Kingsley, Dickens, Lytton, Macdonald, and others have described shoemaker types; and it has been remarked as significant that when writers such as Hannah More wished to convey their moralities through a homely medium they chose shoemakers, and set them talking in their shrewd and suggestive way. It may be that notable shoemakers would have been noteworthy whatever their occupation in life. It may be that Thomas Edward, the Scotch naturalist, whose life Smiles so admiringly describes, would have been as earnest, as devoted, as enlightened, and as persevering, if he had been a stonemason or a smith or a carpenter. But the fact remains that he was a maker of shoes, and that it was in the intervals of this not very inspiring trade, and in spite of the difficulties which poverty and misunderstanding put in his way, that he did so much in the interests of science, and secured recognition very late in the day as a man of altogether exceptional claims to honour.

Yet in spite of the conditions which seem to favour the mental development of shoemakers, there have been those who scouted the occupation. In the Border town of St Boswells there was a shoemaker named John Younger, who wrote his autobiography. The passion for pen-work will show itself, and Younger must needs tell how it was debated in his boyhood whether he or his brother should go to the university. The choice for this distinction fell on the brother. 'So George got on with his Latin, whilst I got on with my shoemaking and mending the best way I could. This craft of mine was the most unproductive and vexatious business, after all—a constant botheration, what with pleasing my customers and looking after my journeymen, who often would not or could not attend to matters so pointedly as was found absolutely necessary. This through a lifetime has entailed a world of hourly care and extra care on myself, with a super-sufficiency of daily vexation. If I had my life to begin again just now, I would rather at once commence henchman to the gipsy king-fisher in the most troubled waters above-ground than be a village shoemaker on the most promising conditions ever brought within the vision of a poor son of the craft.' There seems a querulous discontent about this; the causes assigned are insufficient for vexation so great and continuous; and one must fear that John Younger had ever a longing eye on his brother George's Latin and higher opportunities. A shoemaker who thinks much is often misanthropic; and yet better be a good shoemaker than a bad philosopher. These remarks, however, have not the same unexceptional application to the present time that they have to the time just past. Shoemakers are not nowadays so strongly individualised. They are items in a factory rather than self-complete units in a particularly vigorous system of life. There is a good deal of the old character left; but part of it has gone; and many shoemakers show an

unfortunate tendency to degenerate into machine-made men, as commonplace, and stereotyped, and hopelessly uninteresting as the shoes they help to manufacture.

THE LEOPARD MAN-EATER.

A VERY terrible but true tale of the loss of human life has been received from India. Upwards of one hundred and fifty poor natives in the Rajshye district (or county) of Lower Bengal have been killed by a leopard. It is hardly necessary to say that the people of the villages, over an area of about forty square miles, in which the animal committed its ravages were reduced to a state of misery and terror until their enemy was slain. The Government of Bengal during the past year has been spending hundreds of thousands of rupees to prevent the death of any of its native subjects from starvation or famine; but, so far as can be ascertained, the same Government only offered a reward of fifty rupees, instead of the ordinary reward of five rupees, for the destruction of this terrible leopard, which, towards the end of its career, was killing women and children at the rate of two or three a week.

The special interest and importance of the case is derived from the fact that a leopard is not usually addicted to taking human life. Everybody has heard or read stories of man-eating tigers; but in the records of Oriental sport and natural history, there is, I believe, no mention of a systematic man-eating leopard. Wolves and jackals are well known as prowling about villages and carrying off little children almost before the eyes of their parents. The leopard has been always regarded as the chief enemy of goats and of poultry and of the village dogs. It has seldom tried to molest human beings who did not first interfere with it. The late Mr Wood, in his popular work on Natural History, thus describes the leopard: 'In its own country the leopard is as crafty an animal as our British fox; and being aided by its active limbs and stealthy tread, gains quiet admission into many spots where a less cautious creature could not plant a step without giving an alarm. It is an inveterate chicken-stealer, creeping by night into the hen-roosts, in spite of the watchful dogs that are on their posts as sentinels, and destroying in one fell swoop the entire stock of poultry that happen to be collected under that roof. Even should they roost out of doors, they are no less in danger, for the leopard can clamber up a pole or a tree with marvellous rapidity, and with his ready paw strikes down the poor bird before it is fully awakened.' From this quotation it may be seen that a leopard was looked upon by a generally well-informed English naturalist as little more than a large cat, the deadly enemy of poultry. But this is too favourable a view of its character. A leopard would prefer a goat or a sheep to a fowl if it could get them. It will occasionally kill a calf if it finds the little animal without the protection of the mother-cow. It is very much addicted to killing dogs. The annals of the Indian hill-stations, such as Simla and Mussoorie, contain many stories of the pet dogs of ladies being carried off before their eyes. Even a large dog of the Newfoundland breed has been known to tremble with fear

at finding itself within scent of a leopard. Any fierce dog, such as a mastiff or bulldog, on smelling a leopard, will rush to attack it; but a dog of this kind should always be furnished with a broad leathern or metal spiked collar, to protect its neck from the jaws of the leopard, which invariably tries to seize the dog by the back of the neck.

A leopard has been known to attack and severely wound a man who has gone to the rescue of his own kids or fowls, or who has voluntarily waylaid and attacked the wild beast. But it is quite a new thing that a leopard should assail unoffending human beings and carry off their bodies to devour them at its leisure. Tigers, especially man-eating tigers, are now seldom to be found; but leopards are still numerous in and about the villages of some parts of Lower Bengal, where the jungle, or undergrowth of shrubs and thorny plants, and the high grass afford them shelter. It would indeed be a terrible thing if every leopard in Lower Bengal were to take to killing and eating children and women, after the manner of the beast which has been devastating the villages of Rajshye.

It was in the month of July 1890 that information was given to the Rajshye police that a girl aged four and a boy aged seven had been killed and eaten by a leopard. The report was at first not believed. It was rather suspected that the children had been murdered, or that jackals had carried them off. But in August the villagers came again to the police and declared that the leopard had been seen to kill a boy aged eight, and that on another day it had carried off a baby only six weeks old. Still the police and the superior authorities were incredulous, and nothing further occurred till December, when information was given that a boy of seven had been killed by a leopard. The villagers persisted that it was one and the same leopard that had committed all these ravages. They described it as a large heavy-shouldered beast, with rather a short tail. There is much difference in the size of leopards; and when the skin of a dead leopard is measured from the tip of its snout to the end of its tail, the possessor of a long tail may be represented as a large animal, whereas its head and neck and body were really on a small scale. Any one who looks at the leopards in their dens at the Zoological Gardens can see for himself how much the animals differ in size and substance. Be this as it may, the story of the villagers was soon confirmed by the renewal of the leopard's ravages; for in January 1891 there were no fewer than eight victims. The following list shows how its depredations were continued. 1891—January, eight human beings; February, two; March, six; April, one; May, seven; June, six; July, seven; August, fourteen; September, twelve; October, twelve; November, ten; December, thirteen. 1892—January, fourteen; February, twenty-one; March, thirteen; April, one. It is probable that the number in April might have increased, but fortunately on the 6th of April the leopard was killed by a party of sportsmen, and there was an end of the destruction of human beings.

It will be observed that the old doctrine of *nemo repente fuit turpissimus* applies to the man-eating leopard. The natural fear of man deters it at first; but as it grows bolder in crime, it

finds that it is exceedingly easy to kill a defenceless child or woman, whose delicate neck is crushed in an instant between its powerful jaws. There is no resistance; and it may be that the leopard soon finds that human flesh and blood are delicacies, such as they are said to be in the opinion of most cannibal tribes whose habits have been so minutely described by the adventurous travellers who have resided among them. The first human being that the Rajshye leopard was known to have killed was a little girl about four years old. The child was playing in the courtyard of her parents' house, when just before sunset the leopard sprang upon her, and carried off the body into the nearest high-grass jungle, and was beginning to devour it, when the outcries of the assembled villagers caused it to leave the corpse. It would be monotonous to try to give the particulars of every separate victim. The leopard usually made its attack about sunset. One evening a woman of thirty and her son of ten were returning from a neighbouring market. The leopard sprang upon the boy; but the mother bravely ran to defend him, when the leopard seized her by the neck and killed her, and then carried off the boy's body into the jungle to devour it. This was seen by several other persons returning from the market, who fled as fast as they could. On another occasion a cowherd, on arising in the early morning, missed his mother, who had been sleeping in the same hut at a few yards' distance from him. When daylight appeared, he saw a naked body lying in the courtyard of the house, and he found that it was his mother's corpse. Her neck had been broken, and the leopard having sucked the blood, had left the body where it lay. The body was still warm, and the leopard had probably slunk off on seeing the son moving about. The leopard seems hardly ever to have attacked a grown-up man, although it is stated that six grown-up men died in the course of the year from wounds received by them in attacking it and trying to rescue a victim.

It is hardly necessary to say that many attempts were made by different persons, European and native, to kill the leopard as soon as its ravages became notorious; but they were unsuccessful. The explanation given is that the leopard hid itself in the fields of high sugar-cane, which were impenetrable to man and elephant. The sportsmen usually took out some elephants when they wanted to kill the leopard; but it is very little use to hunt for a leopard with two or three elephants; for the elephants may not be sent into the sugar-cane crops, and if there is no sugar-cane, a leopard can easily hide itself in the thick grass and scrub jungle so as to be invisible to the rider of an elephant. It is true that on the day when the leopard was killed, there were nineteen elephants brought into the field, and they succeeded in driving it out, beating shoulder to shoulder, from a patch of high grass in which it was trying to hide itself. But the leopard was not found, or put up, by the elephants. A poor man, whose wife had been killed by the leopard, had seen the beast climbing up into a tree, and he ran to tell the sportsmen where it was. When it came down from the tree, it was easy to surround it; and after a considerable number of shots, the leopard was killed. It

was a male, and its length was six feet six inches, the head and shoulders being abnormally large. The skin when cured was stretched to seven feet nine inches.

Doubtless, there was no want of courage on the part of the gentlemen who went out to try to kill the leopard; but they seem to have been rather inexperienced sportsmen, and they did not know how to hunt a leopard. If they had had the good fortune to read Mr F. B. Simson's *Sport in Eastern Bengal*, they would have found valuable instruction in the two chapters that he has written on Leopards. In the first place, the leopard should be sought for and shot by the sportsman on foot. Mr Simson writes thus: 'I consider that exposure to a leopard on foot, with due precaution and a proper weapon, is only a fair sporting risk, and accidents must happen occasionally.' Mr Simson is certainly entitled to speak. He shot many leopards on foot; he was twice badly wounded by a leopard, but on one of these occasions a third leopard unexpectedly attacked him from behind, when he had already killed two others in the same patch of grass jungle. Mr Simson mentions that an old French gentleman whom he knew used to go about hunting for leopards with a nondescript sort of dog, half pariah, and half spaniel. 'When this dog smelt a leopard, he would cock his ears, and point out from a respectful distance where the leopard lay. The Frenchman kept on peeping and peering about, wholly regardless of anything the leopard might do in the way of attack, till he could sight the animal. He then killed him, almost to a certainty, with a single shot.' Mr Simson goes on to say that he has hunted leopards with dogs, and has been at several such hunts with other people's dogs. But dogs are either too timid or too plucky, and the plucky ones that go at the leopard get killed. Still the dogs help to find the leopard, and it seems that they might have been used with more advantage in seeking for the man-eating leopard. But to use dogs effectually the sportsman must be on foot. There is no chance of a good combination of dogs with elephants, for the latter hate the dogs, and will run away from them; and the dogs mistrust the elephants, and decline to hunt. Finally, no use seems to have been made of trackers, or of seeking for the leopard by its footprints on the mud after rain. Professional trackers are almost unknown in Bengal; but an Englishman fond of sport soon teaches himself how to track, and can impart the knowledge to one or more of his own native servants.

ABOUT LOCO.

THE enterprising Englishman who emigrates to the south-western prairies of North America with a view to ranching, has many trials awaiting him of which he little dreams in Old England; but to my mind the worst evil of all is to find one's self unwittingly the purchaser of a ranch on which Loco is found. Few people who have not been out West know anything about this plant, which is so much dreaded by cattle ranchmen, and therefore I think a few remarks about it may not prove uninteresting to some readers.

This loco is a pretty plant, something like a vetch in appearance, with white, purple, and red flowers. The leaf is alternately pinnate, and the leaflet lanceolate. It is the first green herbage that springs up after the long winter, and perhaps that is the reason it seems irresistible to some cattle in the early spring. It takes its name from a Mexican word meaning 'mad;' and it is often called the 'Crazy Weed,' from the direful effect it has upon cattle or horses if eaten in any quantity. At the commencement, the poison seems slow in showing itself; the first symptom usually being a dull glassy look in the eyes, which gradually seem to dilate and become wild and staring. To an experienced 'Westerner' this is sufficient warning, and if he is wise, he will remove the animal at once to some distant pasture free from the weed, for if left to graze on the dangerous herb, the symptoms will become more pronounced, the vision becoming impaired, and the victim developing an aptitude for indulging in grotesque antics, sometimes rushing madly about as if demented. When horses are affected, they generally show it first by being troublesome in harness, balking, backing, and often rearing and hurling themselves backwards. A 'locoed' horse has the greatest objection to having its head touched in any way, and consequently is difficult to harness.

The last stage of the disease is a gradual wasting away of the animal; and this ends fatally. I once saw a cow that was badly 'locoed;' the poison had got thoroughly into her system and she was as thin as a rail. Her ribs showed plainly through the skin, and she was so weak she could hardly stand. Her owner had kept her shut in a corral away from the fatal loco, and fed her up well; but she was too far gone, and got so wretched at last that a bullet put an end to her sufferings.

Strange to say, cattle born on the prairies seem instinctively to avoid the plant; and it is chiefly imported animals, often valuable high-grade beasts, that fall victims to their partiality for it. It is very difficult to eradicate loco once it has got a firm hold on a pasture, and I believe the best thing is to plough up the land. It grows in big patches, and in the 'fall' the large pods containing the seeds burst and are carried on by the winds to spread elsewhere.

I was for some time on a ranch where loco flourished wonderfully, in spite of the owner's efforts to get rid of it. He was advised to drown it first with water from the irrigation ditches, and then let the hot sun scorch it up. Note that under this treatment it thrived and spread! Again he was told by an 'old-timer' that the only thing was to cut it down just before it seeded and burn it. He did so; and the next year his best hay patch was thick with loco blossom. Although there is a prevalent idea that loco hay is harmless, my friend would not run the risk of giving it to his horses, and lost the crop.

I once helped to drive a cow from a loco patch

to a corral; the distance was not a mile, and yet with the help of another rider it took us two hours and a half to succeed. The cow ran all over the place in a silly dazed way, until we got our two horses close along each side of her, so that she could not turn easily, and with difficulty kept her moving on straight ahead. Her sight seemed peculiarly defective; on the way, she fell clumsily into an irrigation ditch that she could easily have crossed, and we got her out with no end of trouble. Again, coming to a fence-pole lying on the ground, she stopped abruptly and commenced dancing and plunging about in front of it for some minutes; then, with a great bound, she jumped over it as if it was two or three feet high! A 'locoed' horse of mine while feeding quietly in the stable one morning was seized with a spasm; it reared suddenly, threw itself backwards and broke its neck before two men who were standing by could do a thing to try and save it.

A few years before I went to the southern part of Colorado, where I first came across loco, the weed was spreading so rapidly there that the Government offered a bounty for every ton of it dug up by the roots, which was to be destroyed after being weighed. This wise measure for battling with the evil was frustrated by the greed of some of the Mexicans and lower stamp of ranchmen, who, tempted by the reward, actually cultivated the plant as a profitable speculation, until their unscrupulous business was suspected, and it was deemed expedient to take off the bounty, as the amount of loco that was produced seemed incredible.

There are many theories afloat about loco among Westerners. Some maintain that it is not the plant at all that does the mischief, but a tiny red worm that is found only in its roots, and that animals that are affected must first eat the root and swallow the worm. One man will believe that this worm attacks only the intestines, and another will declare that it finds its way at once to the brain. In defence of this worm theory it is urged that botanical experts have failed to discover anything supposed to be injurious to cattle or horses in the specimens of the plant sent to them for analysis. One daring ranchman I knew actually tasted the leaves, and said they had a strong flavour of salt about them, which would doubtless be acceptable to bovine palates.

I was once talking to an owner of a large horse-ranch, and having noticed that loco grew abundantly on the land, but that his horses looked none the worse for it, I asked the reason. He told me he had lost many until he heard accidentally that salt and copperas together made an effectual antidote to the poison; for by the way he maintained that the plant was injurious in itself, and quite repudiated the worm theory. He said that since he had left the remedy where the animals could always get at it, he had not lost one. It seemed hard to believe in this somewhat homœopathic treatment of the disease, but this horse-owner had the greatest faith in its efficiency. I never met any one else who had tried the daring experiment. I was much interested in the noxious plant, and watched all loco cases that came under my notice most carefully; but whether the trouble arises from poisonous leaves or worms I cannot tell. I dried some specimens of the plant,

and sent them on my return to England to an authority on such things, but he was not able to name it; so I conclude England is at present free from the weed, and I hope she may never have any transplanted to her shores. It may not be uninteresting to close these remarks by saying that in localities where loco is found, a word has been coined from its name, and if people are deficient in intellect, or odd and eccentric, they are designated 'locoed'!

IN PHILIPHAUGH WOODS.

Oh lovely woods of Philiphaugh!
As through your leafy glades I wander,
I watch the shadows come and go—
I watch the sunlight's golden glow—
And listen to the rippling flow
Of Yarrow's streamlet, gliding yonder.

Oh peaceful woods of Philiphaugh!
Where tiny rabbits frisk and gambol
Along the path in baby play—
The mossy path where blooms of May
And beechen boughs o'erhang the way
As slowly, idly, on I ramble.

Oh happy woods of Philiphaugh!
Where sounds the sweet wood-pigeon's cooing,
And pheasant's call, and blackbird's trill;
Where finches warble clear and shrill,
And thrushes pipe with mellow thrill:
All songs of hope, and love, and wooing.

Oh fragrant woods of Philiphaugh!
There hawthorn buds sweet scents are blending
With violets faint, and primrose pale;
While piney odours on the gale
Across my senses softly sail;
Incense from summer winds descending.

Oh dusky woods of Philiphaugh!
Famed in old times of war and glory,
Where Outlaw Murray held his sway;
Where fought Montrose his luckless fray—
While Carterhaugh across the way
Of playful elves sings gentler story.

Oh mystic woods of Philiphaugh!
You beckon me with magic finger;
For cool and calm as falls the dew
From yon far sky of tender blue,
Your spell upon me falls anew,
As daily 'neath your shades I linger.

O blessed woods of Philiphaugh!
In days to come my inward vision
Will bring me, down your paths to stray,
Though earthly feet be far away—
And mem'ries bright will ever stay,
Filling my soul with dreams Elysian.

NOVELISTS' PICTURES.

THE spread of education and the growth of Free Libraries have undoubtedly stimulated the appetite for fiction, and added largely to the great army of novel-readers. The novelist may regard the fact with unconcealed exultation; the man of serious mind, who likes his literature solid, and is not troubled with an excess of imagination, may deplore and condemn this development of the love for what he contemptuously styles 'light reading.' Between these possible extremes is a mass of fluctuating opinion. Many public speakers and writers, when touching on this topic, appear to feel themselves bound to regret, in a more or less half-hearted way, the over-proportionate attention shown to fiction, as evidenced by library statistics and publishers' returns; while at the same time they are obliged to confess that, after all, it is only a perfectly natural phenomenon. Novel-readers, who are of all ages and of all ranks, do not trouble themselves much about the matter. Incident, character, ghastliness, crime, philosophy, theological discussion, humour—all, as exhibited in fiction, attract special classes of readers. A literature that can suit so many diverse tastes, and which is read for such an infinite variety of reasons, needs no formal vindication.

There is one feature in modern fiction of the better class which is especially attractive to dwellers in cities, and to all whose lives consist largely in a daily routine of bread-winning, but not specially interesting or intellectually stimulating labour. These readers find particular enjoyment in what we may call the novelists' pictures. Landscape, seascape, still-life, rural life, are all to be found, with many other kinds of art, often in great perfection, in the pages of popular novels. These pictures can be enjoyed without reference to the stories in which they appear; and one striking scene of natural beauty may remain photographed upon the mind when plot and dialogue, incident and character,

have all vanished into the limbo of forgetfulness.

Scott, encyclopædic novelist as he is—touching all themes, and adorning all that he touches—has not many set scenes of sea- or land-scape, but his interiors are inimitable. The description of the Antiquary's study, with its multifarious contents and wealth of learned litter, is a masterpiece in the Dutch or Flemish style. Other striking pictures of the same school are the drinking-bout in Luckie Macleary's change-house, which so narrowly escaped a tragic ending; the Alsatian tavern in the *Fortunes of Nigel* where Duke Hildebrod admits the fugitive Scotch lord to all the privileges of the Whitefriars; and more than one scene in *Rob Roy*.

Dickens has not much to show in the way of landscape; but the harsh ugliness and mist-laden desolation of the river-side marsh districts haunt the memory of the reader of *Great Expectations*. A few bits might be recalled; but, as a rule, the picturesque in landscape is not much touched by the author of *Pickwick*. The same may be said, though not so strongly, of Thackeray. It would be difficult to point out any complete or striking picture either of land or sea scenery in any one of his novels. Character and humour are all in all.

Hawthorne has several pictures of singular interest and force. Most striking of all, perhaps, is that scene in the *Scarlet Letter* where Arthur Dimmesdale, conscience-driven, ascends at dead of night the platform of shame, where he is joined by Hester and the child. All three suddenly stand revealed as the glare of the lightning-flash for a moment lights up the sleeping town, and shows the strange scene of midnight penance to the eye of the single witness, the mocking Roger Chillingworth. Many of Hawthorne's short sketches are simply pictures drawn by a master-hand, which, being drawn, are left to tell their own tale and point their own moral. Some are wonderfully vivid. There are few more impressive things in literature than *Young Goodman Brown*, wherein the night-walk through the

forest and the scene of hellish revelry at the great gathering of the witches are depicted with extraordinary power.

Among more recent novels, Mr William Black's are pre-eminently rich in pictorial wealth. With such a book, for example, as *White Wings* in his hands, the city-bound reader can behold a succession of invigorating sea-scenes. A few strokes of the novelist's pen and he is in the midst of a broad sweep of sunlit sea; above him strains the bellying canvas, and beyond the few feet of shining deck heave the deep green surges. He feels the spray upon his face, and the salt sea-breeze upon his cheek. What more delightful picture than this can be revealed to the mind's eye of a reader by the fireside, on a December or January evening, when the actual world outside offers nought but mud and mire, damp, darkness, and cold? Scenes of this kind abound in Mr Black's books; but landscapes also are not wanting, as no reader of the *Strange Adventures of a Phaeton* will need to be told. There is a lovely morning picture of woodland scenery in *Green Pastures and Piccadilly*. The early, golden light strikes through the long lines of the trees in a Surrey wood, and a lady, who has risen early to enjoy the sylvan scene, stands motionless to watch the gambols of the rabbits that flash in and out of their holes, and are the only disturbers of the peace that lies brooding among the sun-touched trunks, and on the glorified bracken and underwood.

Sea-pictures of great force and beauty and of an infinite variety are to be found in the books of Mr Clark Russell, a writer who adds to an intimate knowledge of every aspect of the ocean, an unequalled power of vividly presenting to the reader its every phase, its beauty, its music, and its grandeur.

Beautiful and finished pictures of various kinds are also to be found in the works of many other living novelists. Ouida occasionally succeeds in a very marked degree, but too often her pictures are painty and laboured, and sometimes gaudy. There are lovely views of New Forest scenery in Miss Braddon's *Vixen*; and her most finished and artistic novel, *Joshua Haggard's Daughter*, contains more than one picture of Cornish furze-grown common and breezy hill-side that live in the memory. In George Meredith's *Richard Feverel* there is a beautiful river-side scene, wherein young Richard first experiences the delirium of youthful love, which in any collection of novelists' landscapes would assuredly take high rank. Some of Mr Walter Besant's stories of the last century contain elaborate and very carefully finished drawings of quaint interiors. The curiously-named story, *The World went very well Then*, begins with a singularly vivid and faithful reproduction of an ancient apothecary's shop and its adjoining living-room.

George Eliot's first great novel opens with a perfect picture. No reader of *Adam Bede* can

ever forget that country carpenter's shop, sweet with the fragrance of newly-cut wood, where the slant beams of the evening sun light upon the stalwart figure of Adam singing as he works. Admirers of Mrs Poyser do not need to be reminded of the many delightful pictures of grange and farmstead, and of the rich, cultivated landscape of Central England, that adorn the pages of *Adam Bede* and other novels by the same hand. In her later works, where the style becomes more artificial, and where the influence of the sweet Warwickshire meadows and woodlands has only too evidently yielded to that of modern philosophy and metaphysics, George Eliot's brush loses much of its picturesque power. Occasionally there is a touch of the earlier manner. In *Theophrastus Such* there is a passage in the essay on 'Looking Backward' which is strongly reminiscent of Mrs Poyser's country: 'And then the tiled roof of cottage and homestead, of the long cow-shed where generations of the milky mothers have stood patiently, of the broad-shouldered barns where the old-fashioned flail once made resonant music, while the watchdog barked at the timidly venturesome fowls making pecking raids on the outlying grain—the roofs that have looked out from among the elms and walnut trees, or beside the yearly group of hay and corn stacks, or below the square stone steeple, gathering their gray or ochre tinted lichens and their olive-green mosses under all ministries.'

Like all great writers, George Eliot recognises the village inn as the glass wherein country humour and manners mirror themselves. The immortal scene at the 'Rainbow' in *Silas Marner* is perfect in drawing as in humour. Another inn-gathering of a different kind is that at the 'Sugar Loaf' in *Felix Holt*, where Boniface proclaims his political creed in a delightfully simple and yet comprehensive fashion: 'I'll plump or I'll split for them as treat me the handsomest and are the most of what I call gentlemen; that's my idee. And in the way of hacting for any man, them are fools that don't employ me.'

Scenes of rustic life and manners of another kind are to be found in the Dorsetshire tales of Thomas Hardy. His books abound in cottage and tavern interiors, whose characteristics are graphically delineated in a few lines, while life is given to the picture by the Shakespearean-like humour of the clowns, with whose ways and modes of thought the Wessex novelist is so intimately acquainted. Mr Hardy is also a master of landscape. Casterbridge, or Dorchester, with its approaches of pillared shade, is painted with a loving hand in more than one of his novels; and the Wessex downs and fertile vales, dotted with many a quaint old crumbling church tower, are drawn with a vividness and a feeling for natural beauty that afford a constant pleasure to the reader. A little farther west, and we are on the ground which Mr Blackmore has made peculiarly his own. *Lorna Doone* has revealed the

beauties of Exmoor to many a wondering reader ; and the greater Devonian tableland, Dartmoor, is a topic of which Mr Blackmore does not easily weary. There are many pictures of it, both in its sunny aspect, when from an unclouded sky the sun beats fiercely on miles of heather and bog and granite rock ; and in its hours of storm and tempest and driving mist, when danger besets the feet of the unwary wayfarer at every step. Its every aspect may be found depicted in a masterly manner in *Christowell*, *Cripps the Carrier*, and other of Mr Blackmore's books.

It is hardly necessary to mention in this connection the works of Richard Jefferies, for, as a novelist, this wonderful observer of Nature was somewhat of a failure. But poorly as *Revis* and its brethren may rank as works of fiction, they contain many exquisite word-pictures worthy to be placed beside those which fill the pages of his earlier and greater books. Jefferies has sometimes been styled a cataloguer rather than a painter of Nature ; but the criticism is not just. His effects are gained by the perfect rendering of a multiplicity of details, but the arrangement of the material is no mere dry, mechanical catalogue. Every stroke, every detail tells, until the carefully and delicately elaborated picture is complete.

Another great master of the picturesque is Robert Louis Stevenson. There are seascapes in *Treasure Island*, and winter pictures of American woods, deep in snow and haunted by the stealthily gliding forms of silent Indians, in that wonderful romance *The Master of Ballantrae*, that are graven deep on the mental retina of all readers who are gifted with the smallest spice of imagination. The latest of his books, *The Wrecker*, has some very vivid pictures of tropical storms in the South Seas, when 'overhead, the wild huntsman of the storm passed continuously in one blare of mingled noises ; screaming wind, straining timber, lashing rope's end, pounding block, and bursting sea contributed.' But it is, perhaps, in *Kidnapped* that Mr Stevenson's descriptive powers are seen at their best. The 'Flight in the Heather' of Alan Breck and poor David Balfour of Shaws is a continuous panorama of Highland scenery. Here is a western loch : 'It was near noon before we set out ; a dark day, with clouds, and the sun shining upon little patches. The sea was here very deep and still, and had scarce a wave upon it, so that I must put the water to my lips before I could believe it to be truly salt. The mountains on either side were high, rough, and barren, very black and gloomy in the shadow of the clouds, but all silver-laced with little watercourses where the sun shone upon them.' Without any attempt at what is ordinarily called word-painting, with no straining after effect by the use of extravagant and far-fetched descriptions and similes, by the simple but masterly use of a few lines in black and white, a perfect picture is produced.

In the same natural but graphic way the loneliness of a Highland glen is placed before us : 'The dawn had come quite clear ; we could see the stony sides of the valley, and its bottom, which was bestrewn with rocks, and the river, which

went from one side to another, and made white falls ; but nowhere the smoke of a house, nor any living creature but some eagles screaming round a cliff.' The scene changes to 'a cleft in the head of a great mountain, with a water running through the midst, and upon the one hand a shallow cave in a rock. Birches grew there in a thin, pretty wood, which a little farther on was changed into a wood of pines. The burn was full of trout ; the wood of cushat-doves ; on the open side of the mountain beyond, whaups would be always whistling, and cuckoos were plentiful.' Loch and glen and mountain side need only the desolate moorland to complete the picture of the Highlands : 'The mist rose and died away, and showed us that country lying as waste as the sea ; only the moorfowl and the peewees crying upon it, and far over to the east, a herd of deer, moving like dots. Much of it was red with heather ; much of the rest broken up with bogs and hags and peaty pools ; some had been burnt black in a heath-fire ; and in another place there was quite a forest of dead firs, standing like skeletons.'

It is not every writer who can paint a picture in plain prose, who can set forth in a few lines a scene, distinct as life and instinct with life, before his readers' eyes. The rendering of colour is a further difficulty. Poetry lends itself more easily to the art. Shelley, when Ione describes the shell that Proteus presented to Asia, gives a perfect picture in three lines :

See the pale azure fading into silver,
Lining it with a soft yet glowing light ;
Looks it not like lulled music sleeping there ?

Shelley's delicately beautiful drawing and Keats's gorgeous colouring are beyond the reach of the humbler artist in prose. The novelist's pictures, life-like though they may be, must always partake to some degree of a Quaker-like simplicity in the matter of colour. In compensation for this defect, the novelist can give us greater firmness of outline and a more realistic rendering of details. And these two qualities go far to make the perfect prose picture that delights the eye of the reader, and remains engraved upon the tablets of the brain, a thing of beauty which is a joy for ever.

THE IRONY OF FATE.

CHAPTER VIII.—ESCAPED.

Two days had passed, but nothing fresh occurred to excite further alarm or suspicion in the mind of Arabella Alsworth. Lord Cransford still remained a guest at the Hall, and was unusually kind and amiable in his manner to her. Major Bowyer, on the contrary, preserved an appearance of indifference, almost of contempt, which ill concealed the rage that filled his mind and heart.

On the third day, shortly after breakfast, Thomas the footman knocked at the door of Arabella's sitting-room and asked if he could speak to her, and being told to 'come in,' he entered cautiously and closed the door.

'What is it, Thomas?' she asked.

'Are you quite alone, miss?'

'Yes, quite alone.'

'Excuse me, miss, but did you get a letter this morning?'

'No. Why do you ask?'

'You won't let master know that I told you—will you, miss?'

'No; you may depend on my secrecy.'

'There was one for you, miss; I saw it on the Major's desk. I thought you wouldn't get it, from what I overheard. It's a plot, miss, against you: you are to be carried off and compromised—that's what they said.'

'Who said so?'

'Lord Cransford and master. They talked about post-horses and chloroform.'

'How came you to hear all this?' asked Arabella.

The man hung his head and grew quite red in the face. 'I heard your name, miss, and I couldn't help it—I listened.'

'Very wrong, I know, Thomas; but very fortunate for me.—Thank you very much. This information is most valuable. It is very kind of you, and I shall not forget it.'

'Just one word more, miss. If you've any secrets, don't trust 'em to Mrs Manser; she's in the plot.'

When the man was gone, Arabella sat down to think. It was, then, as she had suspected—her letters had been intercepted. Fortunately for her, her suspicion had been so far aroused that she had herself posted the last letter she had written to Frank. This annoyed and vexed her beyond measure, for she had very little doubt not only that her letters had been intercepted but that they also had been read. That was, however, of small moment. The idea of being compelled to marry Lord Cransford was most repugnant to her, and it was now evident that, by fair means or foul, her uncle intended she should be Lord Cransford's bride; and, if no other means would serve their purpose, her reputation was to be tarnished. She could hardly realise that men could be such monsters; but at anyrate she must meet plot by plot. She was not safe under her uncle's roof. If she staid any longer at Clumber Park, she felt sure her doom was fixed. She must either flee or tamely submit. She resolved on the former, whatever might be the consequence, and now thought of nothing but how this could be accomplished.

She was not long in deciding on the course she would take; she had plenty of money, for the greater portion of her quarter's allowance was still in hand; and she had a goodly number of jewels, many of which were valuable. When all in the house were asleep, she would steal down-stairs and make her escape. She would make her way to London, take some cheap lodgings in one of the outskirts, and wait till she was of age. If her funds did not last, she would apply to Mr Ainsley; she felt sure he would assist her. Indeed, if she did not change her mind, she had half decided she would go to him at once and seek his advice. At anyrate, rather than return

to her guardian's protection, she would work for her living—do anything, rather than be tied to such a man as Lord Cransford.

So the day passed; and a little after midnight Arabella, dressed very plainly, opened her chamber door, and listened. All was silent. She took up her bag and umbrella and advanced to the top of the stairs, and again listened. All silent. She passed softly down the carpeted stairs, and, approaching the door, was endeavouring to lift the great bar which secured the entrance, when she was startled by the sound of voices in angry altercation, and she paused, letting the bar drop softly back into its place. The next instant the study door was flung violently open, and Lord Cransford came out, cursing loudly, and vowing that Major Bowyer was a cheat. For a moment Arabella was so paralysed with fright that she could not move. The light from the study fell full upon her, and she expected every moment to be discovered and dragged into the study and an explanation demanded.

It soon became evident that the two men were in an advanced state of inebriation; and the language used by Lord Cransford was of such a character that her soul revolted at it; but what roused her indignation most was to think that her uncle wanted to marry her to such a man. The thought made her shiver.

After a good deal of remonstrance and persuasion Lord Cransford was induced to return to the study; the door was closed, and all was once more quiet.

'What should she do now?' was the question Arabella asked herself. 'Should she unbar the door and make a dash for liberty? Or should she return to her room and wait a more favourable opportunity?'

She chose the former, and again essayed to lift the weighty bar—this time successfully. The key was turned; the latch was lifted; the door swung open; there was a strong rush of air and then the report of a door closing. Arabella was startled; but she had sufficient presence of mind to shut the Hall door quickly, yet quietly, and hurry off down the avenue leading to the lodge. She hastened on till she reached the gates, and, to her great disappointment found them locked. This, to a girl of Arabella's temperament, was not an insuperable obstacle. She was strong and agile; and finding a place in the wall where she could reach the top, she drew herself up, dropping softly on the other side. She paused for an instant to listen: not a sound could be heard but the roaring of the wind. Thus far all had gone well; and she started to walk along a country lane leading to a distant village.

Major Bowyer was never an early riser; but on the morning following Arabella's flight, he was unusually late, both he and Lord Cransford having indulged more freely than usual on the previous night. The first thing he did on entering the breakfast-room was to inquire for Arabella, and he was told that she had not yet left her room.

'Go and call her; tell her I'm waiting for my breakfast,' he said testily.

Thomas left the room, returning in a few minutes with the intelligence that Miss Alsworth was not in her room; and her maid said that the

bed had not been slept in. Search was at once made high and low, but no Arabella could be found.

Major Bowyer's stern and dark though still handsome countenance was more dark and lowering than usual when he realised the fact that his wicked plot had been defeated and that his victim had escaped. He was still more annoyed when Lord Cransford, on hearing of her flight, announced his intention of throwing up the game and proceeding to London by the next train.

Major Bowyer was, as may be imagined, dreadfully irate at Lord Cransford's desertion; and Thomas and the grooms who were sent to scour the country in search of the fugitive had rather a bad time of it; and in the end, when no tidings could be obtained of Arabella, Major Bowyer retreated to his study, there to drown his anxiety and vexation in his accustomed potations.

Arabella, previous to starting, had carefully arranged her plan. She had decided that, instead of taking the train for London from the nearest station, she would walk to a small town some three miles distant, and take the down-train for Exeter. On her arrival she at once proceeded to the Queen Street Station, with a view to take the up-train by the South-western to Waterloo. Here, finding that she had over two hours to wait, she proceeded to a waiting-room, where she had not been long seated, when an old lady and her maid entered and sat down not far distant. The lady seemed of rather a garrulous nature, and after dilating on the stupidity of railway directors in not having trains ready for people, and telling Arabella where she was going to, she said: 'You seem to have no one with you, my child; you are very young to travel alone.'

'Yes, I am quite alone,' replied Arabella.

'And where is your destination?'

'London.'

'Have you friends there?'

'No.'

'I'm not inquisitive,' said the old lady after a pause; 'but I should very much like to know what is the business which is taking you to London?'

'No business at all. I've run away from my guardian.'

'Run away! What for?'

'Because he wanted to marry me to a bad man, a man I hated.'

'And you are going to London alone, and have no friends there! Why, child, you must be mad!'

'Oh! I've got plenty of friends, but not in London;' and then the poor girl, who was moved by the tender tones of the stranger, told her the whole story. When Arabella mentioned the name of Lord Cransford, the old lady started.

'Lord Cransford!' she exclaimed. 'My dear child, what an escape you've had! He's the most disreputable young man I know. I don't wonder at you running away; but to go to London without money or friends!'

'Oh! I've plenty of money,' retorted Arabella; 'so, if you will help me to find respectable lodgings when I get there, you will be doing me a great service.'

'Lodgings, child! Let you go into lodgings all by yourself! No, no; I'm going to take you home with me.'

'Oh yes, gladly, if you will let me pay for my board and apartments.'

'I don't let apartments, and I don't take boarders,' replied the old lady, 'but I wish to have a companion for a time, and I have taken a fancy to you, if you will come.'

'I am not sure,' replied Arabella, 'that I would be right in engaging myself permanently, more especially that I have money to pay for what I want.'

'Don't you see,' answered the lady, 'that a girl, a beautiful and attractive girl like you, living alone in lodgings, would be in great danger? It's not to be thought of. You do not know me, and I admire your independence. Indeed, if you will not accept of my invitation, I do not know what can be done; however, we will talk more about it in the train, as I see Johnson has taken our tickets. You had better get yours. Have you any luggage?'

'No, not any,' replied Arabella, with some hesitation. She was looking with something like dismay at the grand gentleman in livery who addressed the little old lady as 'Your Grace!' She felt hot and red, and ready to sink into the earth. This lady to whom she had offered payment for her board and lodgings was a Duchess! It was a dreadful situation; but at the moment there was nothing to be done but to get her ticket, which she did at once.

When they were seated and the train had started, the old lady turned to Arabella and said laughingly: 'Now, child, will you refuse to accept my offer, if I refuse to take payment for your board and lodging?'

'No, no,' replied Arabella, blushing hotly.

'Pray, pardon me; it was done in pure ignorance.'

'I know it was, child; and I'll forgive you if you will let me shelter you for a time at least. I really think it was a special providence that arranged we should be thus thrown together. There is no knowing what might have happened if I had not made a mistake in the train. You are young and inexperienced. You say you have money; you might have been robbed.'

In pleasant chat, the time passed quickly, Arabella every minute growing more in love with this delightful old lady, who was doing all she could to make the poor girl by her side feel at her ease; and the train steamed into Waterloo Station almost before she knew where she was.

A carriage with more tall gentlemen in livery awaited them, and they were at once driven to a mansion in Berkeley Square.

The Duke met his wife in the hall and greeted her tenderly.

'Now, John, dear, I want to introduce this young lady to your notice; but we'll go up into the drawing-room, because I'm going to give you a surprise.'

When they were alone, she commenced: 'This is Miss Arabella Alsworth, who has run away from her guardian because he wanted her to marry our scapegrace of a nephew; and this, my dear,—turning to Arabella—is my husband, the Duke of Falmouth!'

Arabella was struck dumb with astonishment. That she should in this way have stumbled upon

near relatives of the man she was fleeing from seemed impossible.

'So you preferred to run away rather than marry a handsome man, and become a peeress, and the future Duchess of Falmouth!' smiled the Duke.

'Yes; good looks without good principles don't go far with me,' said Arabella; 'and as for titles, if you will pardon me for saying so, I have never set much store by them.'

'Well, my dear girl,' said the Duke pleasantly, 'I like your principles and I admire your frankness.'

'So do I,' interjected the Duchess. 'What do you think she told me, John? That she would not accept of my hospitality unless I let her pay for her board and lodging.'

'Capital!' laughed the Duke. 'What did she propose as a remuneration?'

'Oh, I don't know—I did not ask her. I offered to take her as a companion; but I am not sure that she appreciated even that,' said the old lady, laughing.

Arabella spoke, half pleadingly. 'You said you had forgiven me.'

'So I have; but this is too good a joke to be kept a secret, and you see how my husband enjoys it.'

'That is so,' rejoined his Grace. 'But now for a moment let us be serious. I knew, or fancied I knew, that some day I should have to be introduced to a young lady rejoicing in the name of Arabella Alsworth, and I was quite prepared to find her a silly, empty-headed girl, who wanted to become the wife of a lord, and did not object to pay a good price for the honour. Well, I have had the pleasure of being introduced to her, and I find her a young lady of strong will and determined purpose, who does not care a fig for titles.'

'Thank you,' said Arabella, rising and making him a profound curtsy. 'But,' she continued, 'there is one thing to be said in extenuation of my bad taste in refusing to become Lady Cransford. Before I had the honour of being introduced to your nephew I was engaged to another man.'

'Ho, ho! this is interesting,' said the Duke. 'May I be allowed to know the name of this favoured individual?'

'Yes, certainly. It is Wallis, and he is a Commander in the royal navy.'

'This is really a most remarkable coincidence!' exclaimed his Grace. 'Commander Wallis is also my nephew.'

'Of course he is,' laughed Arabella. 'I knew that long ago; he told me so when he warned me against Lord Cransford.'

'Well, my dear child,' said the Duke after a pause, 'I congratulate you. Frank Wallis is an honest man and a gentleman, and I respect him. He and his mother have only two faults—they are very proud and very poor.'

'Oh, you must not say anything against Frank!' flashed Arabella, 'or I shall pick up my belongings and make tracks for Camden Town or some other suburban retreat.'

'Make tracks!' expostulated the Duchess; 'who taught you to use such an expression as that?'

'I don't know, but I think it was Lord Cransford.'

There was silence for a few minutes, and then the Duchess said: 'Come with me, child, and we will make ourselves presentable; the dinner bell will ring directly.'

THE SENSE OF HEARING IN ANIMALS.

It is not necessary to explain here the complicated structure of the human ear, nor the marvellous way in which rapid movements or vibrations of the air, after reaching our outer ear, are thence conveyed to the brain, and there perceived as noise, or, if sufficiently regular and rapid, as musical sounds. We do not find exactly the same structure in other creatures, nor is the organ of hearing always in the same place or of the same shape. What is usually called the ear—that is, the external ear—is of course but a small part, and not a really essential one, of the organ of hearing. Some creatures have no external ears; while in others, such as hares, and also in nocturnal creatures, the external ears are very large, and serve as ear-trumpets or resonators. Those living underground, on the other hand, have none, neither have reptiles; yet we know the latter can hear and be influenced by sounds; indeed, snake-charmers all use music as one means of taming snakes. Beasts of prey, lions, tigers, &c., have their external ears standing forward to catch sounds in front. The creatures they hunt have theirs turned back, so that they may hear when their enemy behind is pursuing them. The skate tribe, in contrast to this, have their external ear orifices on the top of the head. The external ears of bats are greatly developed; in many, they are longer than the head; and in some kinds they are nearly as long as the body and head together! They are also very mobile; and the bat can, at pleasure, move each ear independently of the other, the better to catch sounds. The fennec, a species of fox, has, however, the largest ears in proportion to its size of any animal.

The auditory organs of different insects are not only in different parts of the body, but in some are in more than one part; they also differ in construction, some being far simpler than others. There is evidently an organ of hearing in the antennæ of some insects, though it may not be confined to this part of the body; in locusts, for example, the organ is in the abdomen; while grasshoppers and crickets have ears in their anterior legs. These latter are two oval, glassy structures, whose purpose was for long a puzzle to observers; they are now, however, known to consist of a group of cells varying in size, each cell being in connection with a nerve-fibril and containing an auditory rod.

The wood-cricket makes a loud noise by rubbing the edges of its wing-cases together. This noise is so loud that in some countries it is kept in captivity as we should keep a bird, and its note can be heard from one end of a village to another. These are call-notes or love-songs, and are made by the males only. The common field-cricket in the same way sits at the entrance of its burrow stridulating or making this peculiar note till a female approaches; then a softer note succeeds, and he caresses the female with his antennæ. The house-cricket acts in a similar way, as do many other insects. The musical instruments

thus used are different, but the object of this insect music is the same. It is therefore certain that other insects of the same family can both hear and take pleasure in the sounds thus made by the males, or they would not be attracted by them.

One other example of the fact that insects purposely make sounds in order to be heard by their mates may be given. The female of a pair of beetles was put inside a box, where the male speedily found her by the noise she made, locating the sound by his antennæ. He took no notice of her until this stridulating noise began; so it was not by smell he discovered her; and further, he failed to find her when his antennæ were removed. Beetles and moths may also be frequently seen moving their antennæ towards the place from which a sound proceeds.

In a recent number of *Nature* (October 6, 1892) Dr Alcock, of the Indian Marine Survey, describes a red crab which has a stridulating apparatus similar to that of some insects. The object of the noise in this case appears to be to prevent intruders from entering an already occupied burrow; for if one approaches, the crab remonstrates, at first gently, but more and more loudly and shrilly if the intruder does not at once retreat.

The mosquito has feathered antennæ, and it has actually been proved that the different minute hairs of which these feathers are really composed respond to different notes; thus, some hairs respond strongly to the note C (five hundred and twelve vibrations per second), which is the note made by the female; other hairs respond to other notes—that is to say, the various hairs begin to vibrate when their own special notes, and those only, are sounded. It is as yet somewhat uncertain whether ants, bees, and wasps can hear; or, at all events, if they can, their range of hearing must be very different from ours, for they take no notice of sounds whether made by the voice, violin, or tuning-fork, whatever may be their pitch. However this may be, whether they can hear or not, ants appear to have auditory organs in their antennæ; they are of a peculiar form, consisting of a long tube, sac, and then a nerve: these may serve as microscopic stethoscopes, as it were. A little creature something like an ant can certainly make a chirping noise by rubbing a ribbed surface on its body; ants have a similar rasp or nutmeg-like surface, though they make no sound that we can hear, except, some say, a kind of whine when irritated may, however, be audible to themselves.

The sounds made by many insects change according to their feelings; one wasp, a very clever builder, brings the little pellets of earth for its pouch-like nest with a song of triumph, a busy hum succeeding, as it begins work. Certain sounds are also said to accompany certain acts: thus a sting is preceded by a sharp sound. Shakespeare appears to have known this, for, in *Julius Cæsar*, Cassius says:

But for your words, they rob the Hybla bees,
And leave them honeyless.

Antony. Not stingless too.

Brutus. O yes, and soundless too;
For you have stolen their buzzing, Antony,
And, very wisely, threat before you sting.

An angry bee's hum is different from the hum of the merely busy bee. Bees' wings vibrate some four hundred and forty times per second to make their ordinary sound, thus producing the note A, but a tired bee makes the note E, produced by three hundred and thirty vibrations a second. A house-fly makes almost exactly the same note, its little wings actually vibrating three hundred and thirty-five times per second to produce its familiar and irritating buzz. That this almost incredible speed is really attained, and is not mere guesswork, is known in two ways. First, the exact number of vibrations necessary to produce this sound is well known; and still further to prove the fact, a fly has been so fixed that each movement of its wings made a mark upon a rotating cylinder; the marks were then counted; and the calculation as to the number of movements of the little fly's wings, which had already been made from the sound produced, was proved correct.

Spiders, too, can certainly hear. Many drop out of their webs on to the branches below—probably from the habit of thus protecting themselves against wasps—on hearing a shout or sound made by a tuning-fork; others try to seize it; while a high-pitched shout caused several of another kind (the diademas) to raise their legs and strike at the imaginary insect. Spiders are equally attracted by notes of a low pitch, but a very loud sound causes them to retreat; while a heated tuning-fork fills them with terror.

Scorpions have a sensitive ear for most sounds, including those made by a violin. They are even affected by sounds which are quite inaudible to the human ear (does it sound paradoxical to speak of an inaudible sound?); while a tuning-fork so angers a scorpion that it will attempt to sting the fork, if near enough. Blowing air on them immediately stops their flight. Two appendages—or antennæ—under the thorax of scorpions probably represent their organs of hearing.

Reptiles, amphibia, fishes, and even creatures as low down in the scale of life as the jelly-fish, all have auditory organs; but whether this always and necessarily implies the power of hearing, is still somewhat doubtful.

Some molluscs, for example, the fresh-water mussel, can boast of auditory organs—of very simple structure, it is true—in their feet; so can the cyclas, a bivalve. In fact, do not we ourselves sometimes use other organs besides the ear for hearing? After Beethoven, for example, became deaf, he used to hear by pressing a stick against the piano, while the other end touched his teeth.

Birds undoubtedly have a very keen sense of hearing; thrushes may often be seen intently listening for worms underground, while many can also accurately imitate a great variety of sounds. Parent birds may sometimes be noticed teaching their young ones to sing; some young wrens were lately seen sitting in front of their mother, who was singing; one young bird tried to imitate her, but after a few notes, failed. The mother then began again, when the young bird made a second and a third attempt—at each effort, singing a few more notes correctly, until the whole song was learned. Each of the

young birds was taught in the same way until all could sing.

The higher animals, as is well known, are conscious of sounds; indeed, the horse and the deer have a very acute sense of hearing; while many animals, the dog and the cat, for example, can discriminate between different tones in the human voice, and even between different notes in music. A dog distinguishes perfectly well between a scolding and a caressing tone; while one dog was noticed invariably to howl at the note D, whether played or sung; and Gautier writes of a cat that had a similar dislike to the note G, and always tried to silence the note or the person producing the sound. Livingstone describes a monkey concert he once overheard: screams, chattering, the noise of pebbles dropping and of wood purposely struck against hollow trees, all combined to produce—as one can easily believe—a quite unique effect. Then there are the howler monkeys of America, so called from the hideous noises they keep up the whole night long. Travellers say these sounds can be heard at a distance of two miles, and that the imitation of various animals, together with the sounds of roaring, groaning, and moaning, are enough to make one believe that half the beasts of the forest are in deadly combat. These dismal noises are mostly made by the males; the females join in, but with a less harsh cry.

Cows, again, are very partial to music, and have been known to follow a singer repeatedly, as closely as possible. So will wild cattle. In fact, the power of singing has more than once been the means of rescuing people from certain death through a threatened stampede of wild-cattle in the prairies of America.

In the human ear there are fibres differing in length and in tension, each—according to the ingenious theory of Helmholtz, published a few years ago—responsive to a sound of a certain pitch and to that only. From thirty to thirty thousand vibrations per second are the limits of sound usually audible to the human ear, or about seven octaves; and in the ear are some two thousand eight hundred fibres, or about four hundred to each octave of sound. A difference of about one sixty-fourth of a tone is audible to a trained ear; indeed, some musicians can distinguish even smaller differences. A later theory, however, also propounded by Helmholtz, is that segments of the basilar membrane are stretched like a series of strings, with varying degrees of tension, each string responding to a sound of a particular pitch. This latter view is supported by the fact that though birds have not these fibres—or rods of Corti, as they are also called—they can distinguish differences of pitch. But, on the other hand, the result of experiments made on the *Mysis*, or opossum shrimp, points to the truth of the earlier theory. This little crustacean has two ears, or auditory sacs, in its tail, the different hairs on which respond to different notes; thus, on blowing a keyed horn, one hair was found to respond weakly to D, but strongly to D sharp, another to G; and so on.

One other part of the inner ear must be noticed here—namely, the otoliths or ear-stones, found in the semicircular canals, of which the use, to us at all events, is not yet clearly understood, but which are of great importance in the ears

of some creatures. The crustacea, for example, mostly have a very simple hearing organ; it is merely a sac containing fluid—in which are the otoliths or ear-stones—with feathered auditory hairs, and is found at the base of the lesser or inner pair of antennæ—the antennules. This sac is cast with each moult, and with it, of course, the ear-stones; and it has been observed that the crustacea often actually pick up and place in their auditory sacs little grains of sand to serve as otoliths. Perhaps they intensify vibrations. They may easily be observed in the cod, in the shape of a flat white stone in the interior of its head. A theory has quite lately been advanced by Professor Crum-Brown to the effect that these otoliths, which are closely connected with the semicircular canals, are really the organs of a recently-recognised sense—that of rotation; that is, that instead of the otoliths responding to auditory vibrations, they and the fluid in the semicircular canals are aids to recognise changes of motion and its direction. (It would be out of place to refer at length here to the fact that one vertebrate, and only one, has but two, instead of three, semicircular canals. If these canals do serve to indicate direction—the three canals corresponding to space, as we know it, of three dimensions—does the absence of one canal point to a possibility of space being limited to two dimensions in some creatures?) In the blind-fish these canals are found to be unusually large; while the otoliths are sometimes single, sometimes numerous. If single, they are free; otherwise, they are held in position by the gelatinous surroundings.

Animals may hear sounds that are inaudible to us. Certainly the sounds that give the keenest pleasure to many animals—cats, for example—are seldom capable of giving pleasure to us. We know, of course, that sounds may be too low or too high—that is, the vibrations may be too slow or too rapid—to be audible to the human ear; but it does not follow that they are equally inaudible to differently-tuned ears. The limits of audible sound are not invariable even in the human ear: women can usually hear higher sounds than men, and the two ears are not, as a rule, equally keen. A sound may be quite inaudible to one person and plainly heard by another. Professor Lloyd-Morgan mentions as an instance of this a case in which the piping of some frogs in Africa was so loud to him as almost to drown his friend's voice, but of which his friend heard absolutely nothing! The same thing may be observed by any one possessing the little instrument known as Gaiton's whistle. The sound made by this whistle can be made more and more shrill, until at last it ceases to be heard at all by most persons. Some can still hear it; but by raising the sound still higher, even they cease to hear. The sound is still being made—that is, the whistle is causing the air still to vibrate, but so rapidly that our ears no longer recognise it, though the existence of these inaudible vibrations is detected by a 'sensitive flame,' as was first shown by Professor Barrett in 1877.

If we dared, at the close of such a long and, we fear, somewhat dry article, touch upon metaphysical subjects, we should point out what a wonderful thought is thus opened before us—

that the world around us may be filled with all manner of noises and musical sounds, which only our deafness prevents us from hearing, but which at some future day we may be able to recognise. Instead of science and knowledge taking away from the beauty of the world, do they not constantly open our eyes to fresh wonders and possibilities, teaching us that the world is far richer, and vastly more interesting, than we ever imagined it to be in the days of our ignorance?

THE VALLEY OF SHEITAN.

A STORY OF THE BHORE GHÁT INCLINE.

By HEADON HILL.

IN TWO PARTS.—PART I.

A RAGGED blear-eyed vulture sat lazily preening itself on the topmost summit of 'The Duke's Nose,' one of those solitary peaks which dot the slope of the Western Gháts towards the plain of the Konkan below, and which are in themselves miniature mountains rising on the rugged face of the great range. The bird suddenly paused in its toilet and sniffed the air. There was a moment's deliberation; and then, as if with an effort, it launched itself into the throbbing noontide atmosphere, winging its flight in ever-widening circles, which brought it at last within view of its quest. But instead of descending to a ready meal, the vulture was constrained to exercise the virtue of patience on a neighbouring crag. For the cause of attraction rose from no half-eaten relics of a panther's feast, only from the *al fresco* cookery of two young English officers bent on tiffin.

Lionel Heygate and Dick Manners were neither of them particularly imbued with a love of the picturesque, and it was probably by accident, or because of the convenient shade of an 'ashook' tree, that they had selected this spot for a camping-ground in the middle of a day's shooting. The place was a little terrace, twelve feet square, that jutted out from the jungle-covered mountain side. Above and below this natural point of vantage the ground sloped far too abruptly to admit of the operations of the old Mahratta 'shikari,' who was busy heating an 'all-blaze pot' on a fire of twigs.

But though the reason which brought the sportsmen there may have been a matter-of-fact one, the view which they commanded was sufficiently out of the common to hold their attention. Twelve hundred feet below, and, from the steepness of the descent, looking as if a stone could be thrown upon it, commenced the fair stretch of the Konkan plain—the broad belt of fertile land that lies between the foot of the Gháts and the Indian Ocean. Far away in the distance a shimmer of the sea now and again flashed through the sultry haze on the horizon, so fitfully that it might have been taken for the mirage. To the right and left was a wild tangle of mountain scenery. Gorge and ravine, beetling cliff and

giddy precipice, were piled together in bold confusion, all tending upwards to the level summit where lay the vast Deccan tableland. Thickly-matted undergrowth covered everything, softening the rugged grandeur of the ascent with tropical colour. Save for the faint lowing of cattle on the plain below, intense silence reigned.

Suddenly the illusion of perfect isolation was broken by the shriek of a railway whistle and the unmistakable rumble of an advancing train. Manners walked to the edge of the terrace and looked over; then he called to his companion: 'We are just above the reversing station. Come here, Heygate, and see the train come in. It is curious to watch the ways of Clapham Junction in this wilderness.'

Heygate joined his friend. The train was just emerging from a tunnel that seemed to spring from the side of a sheer precipice half a mile away, whence the line was carried on a narrow cornice carved in the shelving rock on to a broad plateau, which jutted out below where the two officers stood. This plateau is the half-way house of the Bhore Ghát Incline, which rises from Karjat, in the valley below, to Lonauli, at the top of the Ghát. The railway runs on to the plateau in the form of a V, the left-hand shank of the letter representing the line which has ascended from the valley, and the right-hand one the line which has to still further ascend by many tortuous spirals and dizzy gradients to the tableland of the Deccan above. The necessity for a reversing station at this point is made plain by the facts that at the apex of the V there is a giddy precipice running down two hundred feet sheer to a jungle-covered ravine, and that the plateau was not broad enough for the daring engineers who planned this mighty work to dream of a curve. Thus both up and down trains run into the reversing station with their engines facing in the same direction, and are stopped about a hundred yards from the brink of the precipice. The engine has then to be shunted round the train, to be attached to what was formerly the rear; and the journey is resumed up the mountain to the right or downwards to the left, as the case may be.

The place is a station only in name. There is no platform, and there are no buildings, beyond a rude hut for the use of the pointsmen who keep watch and guard against the ever present danger of that terrible abyss. The station is not used for passenger or goods traffic. It is simply an engineering contrivance for the convenience of the railway itself, and its main features are the multiplied lines of metals used for shunting and reversing the engines. The contrast between the utter loneliness of the stupendous scenery and the triumph of invention which has invaded it is never more striking than when a train thunders on to the plateau, crowded with noisy passengers—'Sahib-logue' and native.

The train which Heygate and Manners were watching was coming down the incline, and was therefore approaching the reversing station along the right-hand shank of the V. The gradient at

that part of the incline is one foot in forty, and the brakes were hard at work all along the train, while the steepness of the track was further counteracted by showers of silver sand poured upon the metals by automatic sprinklers attached to the axles. At the approach to the plateau, a pointsman stood with his hand on the lever, ready to turn the train on to the proper line for the reversing operation.

'By Jove!' exclaimed Manners, 'I shouldn't care to have that fellow's responsibility. See, Heygate; if he made a mistake in the points, the train would run into that short siding to the right, and thence clean over the cliff. There's nothing to stop it; everything depends on that man's nerve and sobriety.'

'I expect he's got plenty of both, or he wouldn't be chosen for the job,' replied the other. 'That nasty drop there must be the place which the natives call the "Valley of Sheitan," because a train full of coolies went over during the construction of the line. The European railwaymen speak of it as the "Valley of the Shadow of Death."'

'Well, there's going to be no smash this time,' said Manners; 'the pointsman has vindicated himself. A nigger too, isn't he?'

'Half-caste, I should say, by his costume,' said Heygate. 'He is dressed in what he would probably call "Europe" clothes. Besides, the company wouldn't trust a "pukka" native in a place like that. A mild Hindu might be tempted to send the train over the precipice—as an experiment in mechanics.'

The train had come to a halt with much clatter and jangle. From the eyrie perch where the two sportsmen stood it was only possible to see the roofs of the carriages, and the great panting engine, which was being uncoupled preparatory to reversal. An English guard, conspicuous in white linen tunic and sun helmet, descended from his van and walked along the train in the direction of the first-class carriages in the centre. Approaching one of the latter, he opened the door, and, to the surprise of the watchers above, gave his hand to a young lady, who leaped lightly on to the six-foot way. Then the couple walked away together to the edge of the precipice, and from the man's gesticulations it was evident that he was pointing out features in the surrounding scenery.

'That's rather extraordinary, I should imagine,' said Manners, examining the pair through his field-glasses. 'I wasn't aware that the company expected their people to act as guides to tourists. The guard has an excuse, though. The girl is pretty, I think. What do you make of her?'

Heygate took the glasses and brought them to bear on the couple below. The girl was clad in a plain white dress, with a black band encircling her waist; and her broad-brimmed pith hat was bound with ribbon of the same colour. Even at that distance Heygate could make out that her head was crowned with masses of red-gold hair, and that her fair cheeks wore a delicate pink tint, not common among English women who have been over a year in India. She was listening to her companion with an air of interest, and was palpably impressed with the grandeur of the view.

'Yes, she is pretty,' said Heygate, returning

the glasses; 'and not long in the country, to judge by her complexion.'

The guard and the lady strolled back to the train, and passing to the farther side of it, were lost to view. The engine had now taken up its new position, and all was ready for a start. The half-caste pointsman moved over to another set of levers on the down line; a signal arm, a mile away down the mountain side, fell with a jerk; and the train went clattering off the plateau on to the incline, with another eight miles of winding gradients to descend before it touched level ground again.

For a moment Heygate and Manners were so busy watching the sand-brakes as they were brought into play that they had no eyes for the spot the departing train had lately occupied. Heygate's gaze was still turned in the direction of the giddy track when his friend exclaimed: 'Look there, man! What's the meaning of that? The girl has been left behind.'

'And doesn't seem to mind it much, either,' returned Heygate. 'See! she is going to picnic under the shade of that "anjün."'

It was true enough. The trim figure in white had not returned to the railway carriage, but was seated at the side of the line, beneath one of those wonderful shrubs with plum-like leaves and pink and lilac blossoms springing from bough and trunk—a combination which makes you fancy at a distance that you see blue air through the tree, till on coming close the delusion vanishes.

Besides the solitary picnicker and the dusky pointsman a hundred yards away, there was not a sign of life down at the reversing station. The rows of shining metals, glistening white in the rays of the sun, coiled and interlaced in seeming confusion round about the points, and then, diverging, wound away like twin snakes on their several ways, one up and one down the mountain side. But for the girl and the pointsman and the lonely railway track, Heygate and Manners would have looked on primeval wilderness. The picture was so near being one of absolute solitude, that the girl with her paper packet of sandwiches and her homely English dress made a foreground almost startling in its contrast. Somehow, this foreground seemed to convey the idea of helplessness, from the want of proportion between its fragile prettiness and the stern grandeur of its surroundings.

The pointsman came slowly along the line to where the girl sat. As he approached her, he pocketed a pipe which he was smoking and took off his hat, performing both movements with a certain air of ostentation, as though he desired to obtain full credit for his politeness. The girl merely nodded, and went on with her luncheon, listening carelessly while the pointsman stood and talked. It was evident that this was not their first meeting.

Heygate and Manners began to be interested in the scene.

'Extraordinary idyll, this,' said the latter. 'Did you ever see a nigger take his hat off before?'

Heygate had been longer in India than Manners, and put his friend right, remarking: 'He isn't a nigger, old fellow; at least, not a regular nigger. He is a half-caste, and is prob-

ably a good deal prouder of his "Europe blood" than you are. They are a worthless lot of vagabonds—these Eurasians, or Chee-Chees, as the Hindus call them. I wonder that girl allows him to speak to her.'

'She can't very well help herself,' said Manners. 'See! the fellow is getting excited.'

The Eurasian was certainly emphasising his speech, the sound, but not the words, of which had risen so as to reach the unseen watchers. He was gesticulating strangely, and repeatedly struck one hand against the other as he urged some point upon his listener. The girl sat apparently unmoved, except that every now and then she turned her gaze up the line, as if hopeful that some one would come and put an end to what looked like an embarrassing *tête-à-tête*. Suddenly the man paused and stood waiting for an answer to some question he had put, and the reply came promptly in the form of an emphatic shake of the head. What followed was the work of a moment. The pointsman stooped and laid his hand roughly on the girl's wrist; there was a slight scream, a responsive shout from the hill-side, a scramble and a rush, half fall, half somersault, down the jungle-covered slope, and Lionel Heygate, torn and bleeding, pushed his way through the matted creepers on to the plateau and gripped the half-caste by the collar. Manners in little better plight followed.

Heygate slung the pointsman round, and released his hold with a violence which sent the man staggering some yards away.

'I trust you have not been alarmed?' he said to the girl, who had risen from her seat and was eyeing her late aggressor with a look in which there was plenty of contempt, but little of fear.

'I was a little frightened,' she said, acknowledging Heygate's salutation with a grateful smile. 'This place is so lonely. That is the reason why Carnac took advantage. He is too great a coward to do any real harm, I think.'

The pointsman stood glowering at the trio a few paces off, his sallow features three shades paler with suppressed passion. But his manner was outwardly apologetic. 'I meant no wrong,' he began in the servile whine which the unfortunate Eurasians have inherited from the Asiatic side of their ancestry, but which sounds doubly repugnant in the English tongue. 'I only wanted to make Miss Hudson attend to what I was saying; that is why I touched her. I am very sorry.'

'Well, go about your business; and thank your stars I didn't throw you over the cliff,' said Heygate. 'You ought to have known better than to speak to this young lady at all.'

The man slunk quietly back to his levers, and Heygate turned to his new protégée. 'You seem to know the fellow?' he asked, with a curiosity which he tried hard to justify by the circumstances.

'Yes,' she answered. 'I live at Lonauli—the station at the top of the incline—with my father; and Luke Carnac lives there too. He—he worries me a good deal.—You see,' she went on with a slight blush, 'he considers himself a European; and, as my father is in the employ of the railway company also, Luke cannot understand that we don't quite look upon him as one of ourselves. I did not know he was on duty at the points

to-day, or I should not have come here.—Would you mind waiting till the train comes up the Ghât? I am going back to Lonauli by it.'

Of course the two officers assented. A shout to the 'shikari' resulted in the transfer of their temporary camp to the plateau, where, while the contents of the all-blaze pot were being overhauled, Sibyl Hudson was induced to explain her presence at the reversing station. It was very simple. Her father, the guard of the train which had passed, had brought her down to see the wonderful view from the top of the precipice, and had arranged for her to go back by the next train that came up from Bombay. She had only come out from England three months before, and had travelled up to Lonauli at night. Hence the beauties of the reversing station were new to her.

It was not long before the train came clanking up the incline, and pulled up close to where the little party was seated. The guard, who had promised Sibyl's father to give her a lift home, got down and came over to them, looking rather surprised to find his charge in strange company; but he was civil enough when told that the two sportsmen had waited by her request, because she became alarmed at the solitude of the place. The girl seemed proudly reluctant to refer to the impertinence of the half-caste. Even when Heygate, bidding her farewell at the carriage door, said: 'Of course you will get that impudent fellow discharged,' she answered: 'Oh, it is not worth troubling about; Luke will not have an opportunity of being rude again.—But I am very grateful to you for coming to my assistance.'

'May I—that is may we—call and see if you are the worse for your adventure? I mean if we happen to camp near Lonauli?' asked Heygate, loth to let the acquaintance come to an end so abruptly, but not pausing to analyse his motives.

The girl hesitated for a moment, and then looked him frankly in the face. 'I do not know why you should not,' she said; 'you are gentlemen, and—and will be able to understand that it is possible for my father to be a gentleman too, though he is a guard on the railway. He will be glad to see you and thank you himself.'

The train panted slowly over the points, past the scowling half-caste, busy now with his levers. Heygate and Manners stood looking after it as it wound its way along the cornice-like ledge that approached the first tunnel. It was not till the last carriage had disappeared that either of them spoke, and then it was Manners who said: 'No matter what her belongings may be, Miss Sibyl is most assuredly a lady. Father, a service-man come to grief, perhaps.—You seemed rather struck, I thought, Lal?'

Heygate's reply hardly touched the question. He was looking meditatively at the pointsman. 'Come; let's be going,' he said; 'we shall get a shot at a "sambur" perhaps, now that the sun is sinking. If I stay here, I shall punch that nigger's head, and get fined in the district court.'

They shouldered their rifles and stepped out, downwards towards the valley, followed by the 'shikari.' Manners knew his friend, and didn't trouble to point out to him that he was somewhat

inconsistent in his description of the half-caste. Before their trifling adventure, Heygate had pulled him up for calling the man a nigger. Now, Heygate called the man a nigger himself.

BUILDING SUPERSTITIONS.

THE manner of reception by the inhabitants of India of European ideas and customs is full of interest to the student of sociology, and there is often a conspicuous humorous element present. When a pillar-post was first set up in a village in Northern India, the simple people jumped to the astonishing conclusion that it was a new deity, and accordingly decked it with flowers for the purposes of worship. With regard to the recent census, there was great excitement and diversity of opinion. Some of the more careful souls were under the impression that it was a taxing trick. Others—and their name is legion—thought that one object of the census was to procure lists of persons eligible for sacrifice. Not only the census but every public work in the way of bridges or railways excites great consternation. It is believed that every undertaking of this description is started by a propitiatory sacrifice of human beings. As late as the year 1880 the *Times* mentioned that the new harbour-works in Calcutta were regarded with great suspicion by thousands of credulous natives, who firmly believed that persons would be sacrificed to ensure stability to the masonry!

Traces of this curious and gruesome idea are to be found not only in the East but also in Europe, and much light has been thrown on this subject of late by such students of early history as Mr Tylor and Mr G. L. Gomme. It seems to have had its origin in the desire to appease the wrath of the earth-spirit for the intrusion, by digging, into its domain; and blood, especially human blood, was considered the highest offering it was possible to make. In primitive societies it held its place as one of the most cherished institutions, and it is still practised by many of the modern representatives of the first and rudest congregations of men. In Borneo, one is not surprised to find that it is, or was until quite recently, still in operation. At the erection of an important house a deep hole was dug and the first post suspended over it; a slave-girl was then placed in the hole, and at a given signal the post descended, crushing the girl to death. In New Zealand, human beings were first killed and then placed in post-holes; while in the Sandwich Islands it was the custom to bury children. The Fijians, who were in many respects the most advanced and intellectual of all barbarous races, varied the custom in a not unexpected manner, for they killed and ate men when setting up the pillars of a temple; and again held a similar feast when the building was complete. The unfortunate victims were, as a rule, criminals or prisoners taken in battle; but the noble savage was not over-scrupulous in his methods of obtaining the necessary victims, and would quickly make what anthropologists call in the matter of marriage an 'exogamous selection' in default of the usual supply. The Siamese used to adopt the rough and ready way of seizing the first unlucky pedestrian

who passed the newly-completed excavations. The Japanese, on the contrary, if we may credit a certain seventeenth-century account of these interesting people, believed that it was necessary to build on the body of a *willing* victim; and it is said that when a great wall was to be built, some wretched slave, tired of the slings and arrows of outrageous fortune, would offer himself as a foundation, and 'lie down to pleasant dreams' in the trench to be crushed by the heavy stones.

In India, as we have seen, the belief still prevails, and the practice, it is thought, must have been very general at one time—perhaps until the British possession. 'The idea is, I believe, current throughout India,' says Captain R. C. Temple. 'It is certainly as strong in Rajputana and the Punjab as in Bengal proper. Every old or even comparatively modern fort or palace in the Punjab has some such tradition; and the people say it was only the advent of the British in the Punjab, some forty years ago, that stopped the practice.'

The ancient Irish seem to have been convinced of the efficacy of this 'strange architectonic principle,' as one writer puts it, as under the walls of the only round towers yet examined human skeletons have been found. Some authorities think an explanation may be found in the fact that the towers were perhaps built on the site of old churchyards; but the general opinion seems to favour the sacrificial theory. Anyhow, the belief in it is not uncommon in Ireland, and many patriotic natives still think that the early English settlers built their castles on the bodies of the slaughtered Irish; and often point out certain castles under the walls of which human bones have been discovered. Even in Scotland the belief still prevails in some parts that the Picts bathed their foundation stones with human blood. In England, bones have been discovered under the walls of several of the oldest churches, placed in such a position that there is but little doubt that the walls were built over them, though it is unlikely that human life was taken especially for that purpose.

During the dawn of Christianity in these Isles, the priests of the new religion, it is known, often had to effect a compromise between their own doctrines and heathen customs, in order to facilitate the introduction of their creed. But although many strange rites and ceremonies were not attacked, it is impossible to believe that human sacrifices were ever regarded with indifference by those noble 'sowers of the seed,' in spite of the following legend. It is said that when St Columba first attempted to build on Iona, the walls, by the power of some evil spirit, fell down as fast as they were erected. The saint received supernatural information that they would never stand unless a human victim was buried alive. According to one account, the lot fell on Oran, the companion of the saint. Others say that Oran voluntarily devoted himself to ensure the safety of the building. At the end of three days, St Columba had the curiosity to take a farewell look at his old comrade, and ordered the earth to be removed. Oran opened his eyes and said: 'There is no wonder in death, and hell is not as it is reported.' The saint was so shocked at this impiety, that he instantly ordered the earth

to be thrown in again, uttering the words: 'Earth! Earth! on the mouth of Oran, that he may blab no more.' This saying, in its Celtic form, passed into a proverb in the Highlands.

With the increasing spread of a higher religion, by slow modifications the human sacrifice was abandoned; and it is curious to read of the ingenious attempts made to circumvent the devil or local spirits by a substitute. In some places an empty coffin was walled up, and in others a lamb or horse would be sacrificed. By the Quop Dyaks, a chicken is thrown in the post-holes; and it is a remarkable coincidence that in France this kind of substituted sacrifice has survived. In a district of Normandy—La Neuville Chant d'Oisel—a cock is killed, and its blood shed upon the threshold of a newly-built house, in the belief that the neglect of the custom would cause the tenant's death within a year. From discoveries made in Italy, we find that the old Romans, with perhaps praiseworthy deceit, artfully substituted statues and busts for burial under foundations, and hundreds of such works of art have been found buried in this manner. In this case, the resources of art and civilisation effectually modified a grim old superstition. In Roumania, the builders, instead of immolating an offending unit of humanity, take the innocent course of laying down in his stead a rod of the same length as the man, which no doubt produces results equally satisfactory. There is a curious and fairly well known fact bearing on this point in connection with the Cistercian Abbey in Scotland which was founded by Devorguila, daughter of Allan, Lord of Galloway, and mother of John Baliol, the vassal-king of Scotland. Its name was originally New Abbey, but it was afterwards known as the *Dulce Cor*, or 'Sweetheart Abbey,' from the circumstance that on the death of John Baliol, the husband of Devorguila, his heart was embalmed, enclosed in a box of ivory bound with silver, and built into the walls of the church.

As many persons besides folklorists are doubtless aware, there exists in many country districts a popular notion that the first child baptised in a new font is sure to die. Mr Baring-Gould thinks this idea is 'a reminiscence of the sacrifice which was used for the consecration of every dwelling and temple in heathen times, and of the pig or sheep killed and laid at the foundation of churches.'

A corresponding belief is often discovered amongst certain peoples, the knowledge of which is apt to make the 'general reader' assent to the sweeping proposition of the poet, that 'only man is vile.' The foundation sacrifice, as we have seen, originated in the desire to mitigate the wrath of an earth-spirit for encroaching on his possessions; and naturally a water-spirit was regarded by our simple ancestors, with their imperfect knowledge of physical phenomena, as also expecting an occasional tribute. Hence the reluctance, or, rather, superstitious objection to save the life of a drowning man. The Hindu will not rescue a fellow-being, should he fall into the sacred Ganges, for it is thought that the spirit would be defrauded of his just dues. Mr Tylor quotes an account from Bohemia as late as the year 1860 to the effect that certain fishermen would not venture to snatch a drowning man from the water, as they 'feared that

the "water-man" (that is, water-demon) would take away their luck in fishing, and drown them at the first opportunity.' Every reader of this will of course remember the scene in Sir Walter Scott's novel of *The Pirate*, where the pedlar refuses to help Mordaunt to save the shipwrecked sailor. 'Are you mad,' said he, 'to risk the saving of a drowning man? Wot ye not, if you bring him to life again, he will be sure to do you some capital injury?' Scott thought it remarkable that 'so inhuman a maxim should have ingrafted itself upon the minds of a people otherwise kind, moral, and hospitable.' This belief, it is scarcely possible to doubt, was but a survival in a modified form of the above theory; and repulsive as it looks in the light of our present physical and moral theories, it had a certain value in the early days of mankind.

One cannot do better than conclude with the words of Mr Gomme. 'It is not too much to say that the foundation sacrifice—horrible in its most savage form, brutal in its later forms—had very much to do with the preservation of early society. So low down in the scale of man's history there is very little law, very little restraint upon the passions and temper of brute-force. But once placed as a barrier to lawlessness and license the sanctification by blood sacrifice, sometimes, as we know, human sacrifice, and at all events within the home, perhaps within the precincts of the home, what law has not done, the fear of offending local spirits, who have accepted sacrifice, will effectually do.'

'THE SIMPLETON.'

'QUIET to ride and drive.'

Such was 'The Simpleton's' recommendation in the auctioneer's list, and this it was which induced Harry Wentworth, farmer, of Bromford, to attend the auction next day in the adjoining market-town of Essleton. 'I reckon I'm about as good a judge of horse-flesh as any man in these parts,' he said to his wife; 'and if this mare is fit, I'll have her. I want a quiet animal for you and the youngsters to drive; but she'll have to carry me sometimes; and if she can't put on the pace a bit, I shan't buy her.'

The animal's appearance favourably impressed him. Harry Wentworth, though rather too fond of sounding his own praises, was no fool—as are many whose good points would be lost to the world were they themselves dumb—and the auctioneer's laudations fell on deaf ears when Harry sallied forth to purchase horse-flesh or cattle.

'I don't want other folk to judge for me, or to tell me what's what,' he was wont to say; 'I've got brains and eyes, and, thank Heaven, I know how to use 'em both.'

The auctioneer was an honest man. 'There's just one point about the mare, gentlemen,' said he, 'that I may as well tell you of before we begin. I like fair-play, and I don't want a man to come to me in a day or two, and say: "You took me in over that animal: she won't do this," or "she does the other." Now that mare, gentlemen, is perfectly sound in wind and limb. She hasn't a single vice about her; but, as I say,

there's just one thing some of you may consider a failing: she won't take a fence of any sort. And the reason is this. Her present owner rode her in the hunt nearly all last season; and one day, after taking several gates and hedges in grand style, she landed her master and herself in a deep pool, and they had a hard struggle for it, I can warrant you. He's often tried to coax her to jump since, but she always refuses, and that, gentlemen, caused him to name her "The Simpleton." "What's in a name," gentlemen? Well, I've explained it to you in this case. I may add that Colonel Phillimore is heartily sorry to part with her; but as his regiment is ordered abroad, he is thinning the ranks of his favourites.—Now, gentlemen, what shall I say for the mare? And so on.

After several minutes of spirited bidding, 'The Simpleton' was knocked down to Mr Wentworth for a good round sum, and he almost repented his expensive purchase when the excitement of competition was over, and immediately resolved himself into a committee of ways and means to see if he could cut down his expenses in certain quarters, in order to make up for 'this piece of extravagance,' as he called it.

'I reckon I'm the simpleton,' he told himself in confidence, as he handed his cheque to the auctioneer.

Scene—the bar-room of 'The Sow's Ear' at Bromford. Time—8 P.M. *Dramatis personæ*—Tom Lawford, otherwise 'Lazy Tom,' and 'Daft Sammy;' or, to be more exact, Samuel Barrett—the former a young man, till lately in the employ of Harry Wentworth, but discharged by that worthy for persistent idleness.

His companion, Daft Sammy, was about fifty-five, or, it may be, sixty years of age: a small evil-looking man, with cunning gray eyes, and an habitual sneer on his unpleasant countenance. He was the village fool, but shrewd enough where his own interests were concerned, and in reality more rogue than fool.

On this particular evening, Lazy Tom, sauntering through the village, met Sammy, and secured his good-will for an indefinite period by inviting him to partake of a glass of beer, or anything he liked, as he generously put it, in the bar-room of 'The Sow's Ear.' To Sammy's astonishment, but not less to his gratification, he had not one glass only, but several; and having carefully thought his plan out beforehand, Tom, seizing a fitting opportunity, opened fire.

'Ah, you're right, Sammy, my boy,' said he; 'times is 'ard an' work is scarce, an' folks is a starvin'. I daresay now, if a friend was to give you a chance of makin' up for some o' your misfortins, you'd be much obliged to that friend, eh?'

'Try me,' said Sammy, with a knowing leer.

'Well, maybe I will try you,' said Tom, 'maybe I will. I've taken a likin' to you, Sammy, an' I'd like to do you a good turn.'

'Ay, ay, an' Tom Lawford at the same time, I'll be bound,' returned the old man. 'Ah! now, you're a 'cute un, ain't you?' he added admiringly. 'What game be you up to now?'

'Sh! Can't you speak quietly?' said the 'cute un, glancing round cautiously. Then, seeing the coast was clear, he drew his chair nearer to

Sammy's, and whispered: 'You knows the colour o' gold, I suppose, Sammy?'

The restless gray eyes lit up with the fire of avarice. 'Gold!' he muttered—'gold, gold, yellow gold!' his voice rising higher and higher, till his companion roughly shook his arm. 'What was you a-sayin' of, Mr Lawford?'

'You're an old fool,' said Lawford savagely. 'If you can't keep your tongue quiet, you won't smell it even, let alone see it.'

'All right, Mr Lawford—all right; I won't make no noise. What is it?'

'Well, look 'ere, Sammy,' said Tom impressively, laying his hand on the other's arm; 'I'll tell you; but mind, if you wags that clapper o' yours to anybody about it, you'll not only lose your share o' that gold you likes so much, but maybe you'll get a good deal o' what you don't like at all: you knows what I mean?'

'Ay, I understand, Mr Lawford,' said Sammy submissively, and turning pale at the threat.

'That's right, then. Well'—and Tom glanced uneasily round the room again, then went on in a hoarse whisper: 'You knows Farmer Wentworth, Sammy?'

'Yes,' responded Sammy.

'An' I daresay you knows the bank at Essleton, in the High Street?'

'Yes, Sammy knew that too.

'Lor, how thirsty I be: 'ave a drop more, Sammy.'

Not until Sammy had twice seen the bottom of his glass did Tom Lawford proceed.

'Now, Sammy, I places a great deal o' faith in your intelligence, an' I don't think you needs to have things explained to you very much: you seems to see right through 'em at oncet, like, eh?'

'You're right there, Tom Lawford,' agreed Sammy, adopting a more familiar tone under the influence of the liquor Tom had primed him with. 'I can see about 'as fur through a brick wall as most folk.'

'Yes, I know'd it.—Listen to me, then. Farmer Wentworth's goin' to take a bag o' gold to the bank next Tuesday, an' it haven't got to get there.—D'ye twig?'

Oh yes, Sammy 'twigged,' but he had his doubts. 'I don't see how we be to manage it, Tom,' was his answer; 'farmer's a rough chap, an' carries a heavy ridin'-whip, an'—p'raps'—

'Then let somebody else see for you, if you can't see for yourself,' Tom interrupted. 'D'ye think I spoke to you afore I made my plans? Not likely. We can't do it by ourselves, nor in the open.—Here, I may as well tell you straight away, or you'll be a 'inderin' we wi' your opinions, if I tells you bit by bit. I ha' bin thinkin' it over ever since Harry Wentworth turned me off, Sammy, 'ow I might 'ave a bit o' that yellow stuff as 'e takes to the bank every now an' agen. It don't matter to you where I 'eard it, but there's a bit more'n usual goin' to Essleton next Tuesday, an' I thinks to meself, "Tom Lawford, you're out o' work, an' a bit o' that tin 'ud come in useful." Then I wondered 'ow I'd do it, an' who'd 'elp me, an' I thought o' you, Sammy, an' o' others. You're pretty strong, though you be so small, an' you ain't pertickler, I knows, when you're well paid, be you?'

'No,' said Sammy, 'p'raps not; leastways, if it don't get me into trouble.'

'Ah! you're precious careful about that old carcass o' yourn, I knows,' sneered Tom. 'It'll be a pretty good lump,' he added, as though referring to Sammy's diminutive figure; 'an' if he gets it, Tom Lawford won't be seen around 'ere for a long time to come. But you an' the rest can't 'ook it so easy; we should 'ave the bobbies down on us directly. They won't s'pect me, 'owever; I'll leave word I've got a place somewhere. There's Jack Smith an' Dirty Micky, an' three or four fellows as is down 'ere from Brummagem, an' as we've got to do it by daylight, we'll 'ave to disguise ourselves an' alter our clothes a bit, or we'll get copped as sure as you're sittin' in that chair.'

'There ain't goin' to be no murder, is there?' queried Sammy fearfully.

'Murder? No, of course not,' replied Lawford; 'not if we can manage without it,' he added to himself.

'You knows the old spinny, Sammy—"the plantation," as the Squire calls it—with a private road runnin' through it?'

'Ay, ay,' said the old man.

'Well, that's where we're goin' to do the trick, Sammy, my boy. Squire give Harry Wentworth leave to use it, 'cause it's a short-cut. There's a five-burred gate at each end o' the road, an' when Farmer Wentworth—curse him!—comes through the one gate, 'e'll be betwixt the two gates, won't 'e, Sammy?'

'For certin', Sammy replied.

'An' 'e'll 'ave the spinny on each side o' 'im, an' a 'orse under 'im—which means as 'e can't get through it—won't 'e, Sammy?'

Sammy nodded acquiescence.

'An' that ain't all,' said Lawford, rubbing his hands, and chuckling over his plot; 'for when 'e comes through the fust gate, an' gets near the second, 'e'll see a depitation o' four on us ready to wait on 'im.'

'Then he'll turn back,' said Sammy.

'Yes, o' course 'e will, Sammy, an' 'e'll find four more on us gents at t' other gate.'

'You'll be a-hiddin' in the spinny, I s'pose.'

'That's it, an' we shall ha' things o' this sort,' Tom continued, touching a thick oak stick; 'an' when 'e sees as there's no way out on it, 'e'll cuss an' swear a bit, an' then shell out. Then we shall tie 'im up, or 'e'll be at Essleton in a twinklin', an' bring the p'leece after us.'

'You tie Harry Wentworth up? Ha, ha, ha!' and Sammy laughed as loudly as he dared at the idea.

'No, ye daft coon, not me, nor you, but eight on us.'

'E might jump off, an' get away through the spinny,' said Sammy.

'E won't leave the mare till he's obliged, you can bet your boots,' was the reassuring answer.

'Ay, but the mare might jump the gate an' us,' persisted Sammy.

'Didn't I tell 'ee *er can't jump*? Well, 'er can't, or her won't, then; or we'd 'ave to alter our way o' goin' to work.'

'An' what be you goin' to do wi' the creetur?' asked Sammy.

'Oh, fasten 'er to a tree, for if she got 'ome wi' a empty saddle, we'd soon be found out.'

'W'y not seize the reins as 'e comes through the fust gate?'

'W'y not put ourselves in jail at oncet, you means? It's too near the 'ighway, Sammy Barrett. Besides, he'd be usin' that loaded whip o' hisn, an' we might 'ave to tap 'im a few times to keep 'im quiet, an' we wants to do it without that, if we can. 'E'll be fairly flummuxed accordin' to my plan.—Now, mind, if you shows the white-feather, an' don't turn up, you knows what to expect.'

'I'll be there safe enough, Tom Lawford; I'm always about, you knows, when there's any money to be got; but,' he added, a sudden thought paling his cheek, 'e don't carry no pistol, do 'e, Tom?'

'Never!' was the reply; 'never used to at least. But we shall be safe, we shall be safe,' and Tom Lawford thought, with satisfaction, albeit not unmixed with dread, of the two revolvers belonging to his Birmingham friends, which were to be used if needs be—at anyrate to intimidate their intended victim.

'Well, I'm off now,' he said presently. 'Bye-bye, Sammy, an' don't you breathe a word to no one.'

'Harry, dear, I wish you would go round the road instead of through the plantation. You really should be more careful with nearly two hundred pounds about you.'

'Oh, nonsense, Dolly,' said her spouse. 'What silly fear has crept into that pretty little head of yours now? Give me another kiss. I must be off at once. You may trust me to take care of No. 1. Nobody is likely to meddle with a man on horseback in broad noonday. I'll be back to tea—Good-bye, pet.' And he was gone.

Half-an-hour's easy riding brought him to the plantation gate. He opened it with his whip, and rode through, fastening it behind him, and was within fifty yards of the opposite entrance when from out of the thicket four figures appeared, and ranged themselves across the path-way in front of him, close to the gate. He could hardly believe his senses, and would scarcely have been more surprised if a voice had shouted in his ear—'And, Saxon—I am Roderick Dhu!'

The men's faces were hardly visible, being partly concealed by their caps, which were pulled down low in front, and also by their turned-up coat collars, and scarfs tied round the lower half of the face.

'What tomfoolery is this?' thought Harry. 'Well, I must turn back, I suppose. I'm not going to run the risk of a closer interview with those blackguards.'

But when he turned the mare's head round, a cold perspiration broke out all over him, for another quartet of the same stamp had sprung up, as it seemed, from out of the ground, and guarded the gate at which he had entered in the same silent yet unmistakably hostile manner as the others.

'What the deuce shall I do?' he exclaimed in an angry undertone, and half-a-dozen wild and absurd schemes rushed through his brain—a gallop through the thicket—a dash at those muffled figures at the gate—but he felt helpless, almost hopeless.

'The Simpleton,' too, seemed to know that

something was wrong. She fidgeted about, and champed her bit fretfully, as if, like her master, eager to do, yet not knowing what to do. All this occupied but a moment's space.

What was that? A voice behind him calling to him to dismount. He jerked the mare round again, and demanded—'What do you want?'

And the same voice replied: 'Get off that 'oss, an' we'll tell you.'

A bright idea occurred to Harry. 'If only they'll keep at a respectable distance, and I can parley with them a bit, somebody or other will surely be coming this way soon, and then the villains will decamp.'

But they had no intention of allowing him to gain time in that way. 'Look 'ere, mister,' said another, 'be you comin' down or not? 'cause if you don't get off in two shakes, we'll 'ave to make you!'

Wentworth made no reply, but gave a hasty backward glance, which showed him that those behind had not moved, and then, taking a firmer grip of his riding-whip, he sat still as before.

'You won't budge, I can see,' said the last speaker, 'so we'll come an' 'elp you off; an' mind, if you kicks up any fuss, I'll make a hole in you;' and he took a revolver from his breast-pocket.

Still Wentworth did not move.

'Come on, mates!' said the cowardly fellow. 'You there behind, close up,' he shouted to those in the background.

As they drew near, Wentworth made a desperate resolve to dash through them, and, if possible, open the gate, and escape.

They must have read his thoughts, for one of them, Tom Lawford, suddenly snatched a revolver from one of the others, and, turning back, posted himself by the gate again.

Poor Harry was in despair at this last move, but resolved to sell his life dearly, bullets or no bullets, and made a sudden plunge forward, riding-whip uplifted, when they came to within twenty yards of him.

The rascals, surprised at this unexpected attack, drew to each side of the path, with the intention of seizing the reins and striking him with their clubs as he passed, but Harry hit out vigorously right and left, dug his heels into the mare's sides, and shot past them at a mad gallop.

Ping! ping! Two or three shots whizzed by him harmlessly, and then Tom Lawford, in a fit of nervous excitement, took aim at the mare's head, intending to bring her to her knees, but only succeeded in grazing her neck.

Harry tried to check her speed, for they were almost at the gate, but failed.

She had taken the bit between her teeth!

He turned sick, shut his eyes, and clipped her firmly with his knees. As he did so, he felt himself lifted into the air, and the next moment, re-opening his eyes, to his unbounded astonishment, he and the mare were over the gate, and careering along the Essleton high-road at a speed 'The Simpleton' had never equalled when following the hounds in full cry.

When Harry Wentworth returned to the spinny, with a force of six armed and mounted constables, and a dozen volunteers from the

nearest public, he found only one man there, Tom Lawford, and he lying close to the gate, almost at his last gasp. They poured some spirits down his throat, and he looked around wildly. Then seeing the police, he murmured: 'Ah, the p'leece. Ye're cheated for oncet. That mare's done for me. She kicked me somewher as she cleared the gate, an' as I fell, I saw them cowards aflyin' for their lives.—Ah, ye wont 'ave to use the darbies this time. I'm goin'—goin' fast.—Oh, Mr Wentworth, sir, forgive me, forgive me!' Then, suddenly raising himself up, he shrieked: 'No! I won't die! Save me, oh, save me!' and fell back dead.

The rest were caught before forty-eight hours had passed, except 'Daft Sammy,' whose body was afterwards discovered in a brook some miles away.

'The Simpleton's' fame spread far and wide, and Harry had many handsome offers for her, but he refused them all.

'Perhaps she'll oblige me now by taking a gate or a hedge occasionally, Dolly,' he said to his wife.

But 'The Simpleton' was never known to jump again.

THE CHILD-SEASON.

O SUNNY life of childhood! blossoming
To gladden all the world: as if the Spring
Were captive made, and your soft hair unbrid
Had netted all Spring's sunshine as it stirred:
Your little nest has still its singing bird.

O youth! fast learning to be wise and vain,
Whose aims are lofty. In the race for gain
Great things seem possible—and yet to-day
Some grave that is a milestone on the way
Says o'er the world's loud voice, 'Kneel here and pray.'

O hearts that pain has chastened! well ye know
The song of thankfulness. Ye but forego
Your joy a little while. The leaves may tell
Of Autumn; yet be brave: ye have fought well.
Weep not: ye know that other fighters fell.

O aged heads that many a Yule-tide snow
Has whitened! Though the time be long ago
Since first ye laughed in childhood's golden ray,
The Child of Bethlehem takes your hand to-day.
God's blessing crowns your far more perfect way.

HARRIET KENDALL.

* * TO CONTRIBUTORS.

- 1st. All communications should be addressed to the 'Editor, 339 High Street, Edinburgh.'
 - 2d. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
 - 3d. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the *writer's Name and Address written upon them IN FULL.*
 - 4th. Offerings of Verse should invariably be accompanied by a stamped and directed envelope.
- If the above rules are complied with, the Editor will do his best to ensure the safe return of ineligible papers.*

THE VEHMGERICHTE.

THE absence of established laws, or of competent authority to enforce them, has at times given rise to anomalous institutions, which have sought to secure the public tranquillity by means themselves scarcely reconcilable with sound ideas of civil subordination. The Corsican Vendetta and the American Vigilance Societies alike derived their origin from social anarchy, and from the inability of the recognised authority to maintain order or to exact retribution for crime.

During the middle ages, most of the countries of Europe passed through a crisis when the authority of the monarch and of his judges fell into such contempt that the law was entirely without force, and no better protection was afforded by the city than by the open country. Every man's hand was raised against his fellow-man, the most holy sanctuaries were profaned, property was plundered, persons were violated, and the various fortresses scattered throughout the country, so far from sheltering the weak, were converted into dens of robbers, where knightly freebooters levied blackmail from the territories around their strongholds. Our own country passed through such a period of internal chaos in the troubled reign of Stephen, when, during nineteen years, according to the *Saxon Chronicle*, 'the rich men greatly oppressed the wretched people by making them work at their castles, and when the castles were finished, they filled them with devils and evil men. Then they took those whom they suspected to have any goods, putting both men and women in prison for their gold and silver, and torturing them with pains unspeakable; for never were any martyrs tormented as they were. Many were starved; many lived on alms who had previously been rich; others fled from the country. Neither church nor churchyard was spared by the plunderers; they robbed the monks and the clergy; and every man plundered his neighbour as much as he could. Such, indeed, was the misery, that

it was said openly that Christ and his saints slept.'

This state of affairs gave rise in several countries of Europe to popular confederacies, and even to secret tribunals, formed expressly to check such unbounded license, and to secure the ends of justice when its legitimate administrators were feeble or corrupt. The most terrible of those secret tribunals were the well-known 'Vehmgerichte'—or 'Fehmgerichte,' as the word is sometimes written—which existed in some parts of Germany, and especially in Westphalia. The exact significance of the title is disputed, but it is usually supposed to have been derived from 'feh'm,' punishment, and 'gericht,' court, meaning a court of justice. Others imagine, upon inferior grounds, that the term is obtained from the Latin 'fama,' as the tribunals too frequently acted on common fame or report. The origin of these courts has been ascribed to the age of Charlemagne; but there is no authentic record of their existence prior to the middle of the thirteenth century. It is certain that at that time a number of individuals were secretly associated together in Germany to punish crimes and offenders; to put an efficient check upon the lawlessness of the powerful barons, who defied the authority of the sovereign; and to redress cases of grievous wrong perpetrated by any member of the community.

The tribunals were divided into local sections, but recognised a central authority. Nominally, the Emperor was the chief officer; but in Westphalia the actual President was the Archbishop of Cologne. A person of position presided over each branch of the central court, and was known as a 'free count.' The other members were divided into the two classes of 'schöppen,' or ignorant, and 'wissende,' or knowing, the latter class including all those who were initiated into the hidden secrets of the Order. The most solemn oaths bound every one to secrecy as to the proceedings; and there is no evidence that these vows were ever broken, although it is supposed that at one time one hundred thousand

persons were members of these societies. For the determination of civil disputes, the meetings of the tribunals were held in a public place and in the full light of day; but such offences as robbery and murder were usually dealt with secretly. If common rumour ascribed the commission of a crime to any person, or if a charge were brought against him, he was cited to answer the accusation before the court of his district. The summons bore the seal of the *Vehmgerichte*, and was generally fastened to the door of the supposed criminal during the night. If he refused to attend, the citation was repeated; and disobedience to the second summons was considered as conclusive evidence of guilt. The members of the tribunal were bound by their oaths to put such an individual to death wherever they could find him. If, on the contrary, he attended the court, he was allowed to call witnesses, and to clear himself, if he could, by their evidence. Upon his failing to prove his innocence, he was punished, according to the nature of his crime, by fine or summary execution. No one was exempt by virtue of his rank, and the highest noble was as liable to citation as the poorest peasant in the land.

When capital punishment was inflicted, it was customary to leave a knife by the body, to show that the act was not one of a private murderer, but was due to the sentence of the *Vehmgerichte*. The 'wild kind of justice' of these irregular courts was long a terror to evildoers, and, as the tribunals were countenanced by the highest powers in the land, those obeying their decrees were independent of the regular authorities, while the large number of the members, and their wide dispersion, rendered any sentence passed almost certain of execution.

Such rude administration of justice is, however, peculiarly liable to abuse, and in course of time the inevitable deterioration set in. A Diet of the Empire was held at Trier in 1512, when it was declared that 'by the Westphalian tribunals many an honest man had lost his life, honour, body, and property;' and even the Archbishop of Cologne, their nominal chief officer, admitted that 'by very many they were shunned and regarded as seminaries of villains.' As the power of the State gradually consolidated, the irregular courts were suppressed, although they were never abolished by any formal enactment; and it is said that the last remnant of the old tribunals was found in operation in Westphalia when Jerome Bonaparte was king of that country, in the early part of the present century.

A very similar institution, celebrated as the 'Santa Hermandad,' or Holy Brotherhood, existed at one time in Castile, and assumed the most extraordinary functions. At an early period it consisted of a confederation of the principal cities, who were bound together by a most solemn league to defend their liberties in times of civil anarchy. Deputies were appointed, who met

at stated times, and transacted their business with all the forms of the most orthodox institutions. They impressed their documents with a common seal, and enacted laws, which they transmitted to the nobles, and even to the sovereign; and they enrolled an armed force to enforce their measures. The association, 'so characteristic of an unsettled state of society,' says Prescott, 'repeatedly received the legislative sanction; and however formidable such a popular engine may have appeared to the eye of the monarch, he was often led to countenance it by a sense of his own impotence, as well as of the overweening power of the nobles, against whom it was principally directed.'

During the times of lawlessness which preceded the establishment of a united Spanish monarchy under Ferdinand and Isabella, the authority of the sovereign and the royal judges fell almost to a minimum. No better way was seen of checking the unbounded license which had arisen than by reorganising the Holy Brotherhood, and a scheme for attaining this purpose was introduced into the Cortes of Castile in 1476, and was carried into effect the same year. The new institution embraced the whole kingdom, and was limited in its operations to the maintenance of public order. All cases of violence or theft committed on the highways or in the open country were reserved for its jurisdiction, and such offenders as escaped from the cities were pursued by its officers. The open country was specified as the scene for the operations, because it was plentifully studded with castles and fortresses, which offered every facility for the escape of a criminal from justice. The *Hermandad* was supported by an annual tax, levied upon householders; and courts were established in every town for the trial of offences committed within its jurisdiction, while an appeal lay from it, in specified cases, to a superior Council. Its laws were compiled into a code, in which penalties were laid down with the utmost precision. These laws were administered with extreme vigour; stripes, the loss of a member, or even of life, were adjudged for the most petty larceny. Executions were conducted by shooting the offender with arrows; and it was especially provided that 'the convict shall receive the sacrament like a Catholic Christian, and after that, be executed as speedily as possible, in order that his soul may pass the more securely.'

In a few years the *Hermandads* and the new military police established by them almost entirely cleared the country of the swarms of banditti, and of the robber chieftains who had long defied the law. Once again the ministers of justice found a sure protection in the independent discharge of their duties; and, in the words of the historian already quoted, 'the blessings of personal security and social order, so long estranged from the nation, were again restored to it.'

For many years these important benefits secured the confirmation of the institution by successive Cortes; but gradually, as the necessity

for an extraordinary tribunal ceased, the Santa Hermadad dwindled into an ordinary police, and, with such a modification of form, has existed into the present century.

THE IRONY OF FATE.

CHAPTER IX.—RETRIBUTION.

Two days had elapsed since Arabella's flight, and Major Bowyer was sitting alone in his study. Suddenly came a loud ring at the bell; the door was thrown open, and 'The Duke of Falmouth!' was announced.

'I am the bearer of a letter from Miss Arabella Alsworth,' he said, 'if you will kindly read it;' and the Duke placed the letter in the Major's hands.

'Take a seat, your Grace,' he continued, holding out his hand.

The Duke took the proffered seat, but he ignored the extended hand.

When he had read the letter, he turned to the Duke. 'I suppose you are aware of the circumstances which preceded Miss Alsworth's latest escapade?' he queried.

'Yes; you wanted her to marry my nephew, Lord Cransford.'

'That's true. But that is not what I mean. When she left this house, she took a quantity of jewellery with her, some of which was her own, and others were heirlooms, which at the death of Mrs Alsworth ought to have come to my wife, and which I claim as my property.'

'Make your claim in a legal form and the matter shall be investigated.'

'Where is Miss Alsworth staying?'

'In my house, and under my protection.'

'Thank you. I shall go to London at once and take out a warrant for her arrest. Meantime, I shall detain her clothes till the jewellery is restored.'

'Miss Alsworth's business is in the hands of Mr Ainsley, her late father's lawyer. I think you had better see him before you take any ulterior steps,' said the Duke; and taking up his hat, he bowed and left the room.

He was driven back to the station; and half an hour afterwards was on his way to London. When he reached home, he found a telegram awaiting him; it ran as follows: 'From Thomas Foreman to the Duke of Falmouth—Major Bowyer is dead. He was seized with an apoplectic fit shortly after you left. The result, the doctors say, of the agitation and worry of the last few days.'

When he had read it, he went straight to the Duchess's boudoir, where he found Arabella and his wife, told them of the failure of his mission, and read the telegram he had received from Thomas.

'Poor man!' ejaculated Arabella—'how sad.'

'Yes, very,' responded the Duke. 'But what about those jewels?'

'Oh! that was settled years ago. My mother was the eldest child, and they descended to me as her next of kin. Papa took legal advice, and Mr Ainsley knows all about it; besides, at the time, Uncle Bowyer pretended to be satisfied.'

'I think we had better send off to Mr Ainsley,' said the Duke, 'and get him to take such steps as he thinks fit. If your fortune has been in the hands of two such men as Major Bowyer and Lord Cransford, the chances are that matters will want looking into.'

'How good you are!' exclaimed Arabella. 'You think of everything.'

My story is almost ended. The Duke of Falmouth's suspicions were verified. On examining Major Bowyer's papers after his decease, it was found that he had been tempted to appropriate a considerable portion of Arabella's fortune to his own use; and it was supposed that Lord Cransford had been cognisant of, if not a participator in the fraud.

One afternoon in August the two Miss Scudamores were hurrying along High Street, panting and puffing under the broiling heat of the summer sun, evidently in a state of great excitement. They rang loudly at Mrs Montessor's bell, and on being shown into the drawing-room, found the lady and Miss Nugent in close confab.

'Oh my dears! such extraordinary news!' exclaimed Miss Prudence. 'Arabella Alsworth is married, and to whom, do you think?'

'Can't tell, dear,' responded Mrs Montessor. 'There is no telling what such a girl would do. But won't you take a seat?'

'You'll never guess,' said Miss Scudamore, as she seated herself in the proffered chair—'no, not if you were to go on guessing for a month; so I'll tell you—Lord Cransford!'

'But I thought he was dead!' exclaimed Miss Nugent; 'killed in America, to which he had fled from his creditors.'

'Yes, that is so. But this is the new lord, and you'll never guess who he is: somebody we all know.'

'Somebody we all know?' iterated Miss Nugent.

'Yes; but, as you'll never guess, I'll tell you—Frank Wallis!'

'Well, I never!' exclaimed Mrs Montessor. 'Frank Wallis. Then Mrs Wallis must be a lady in her own right.'

'Yes. It seems all like a dream. To think of that quiet Mrs Wallis being a Duke's daughter!'

'Well, I'm glad of it!' exclaimed Mrs Montessor. 'Arabella was always such a dear, kind, amiable creature; and I daresay we shall all be invited to the house when they come.'

Miss Puddicombe laughed sarcastically. 'That's the way the wind blows now, is it? There was

a time when she was a "horrid stuck-up creature."

'Circumstances alter cases,' interposed Miss Prudence.

THE END.

A NORWEGIAN WINTER'S DAY.

WE got to our destination mainly by the little Vossvangen railway from Bergen. It was as wild and eerie a journey as one could have in the depths of the Norwegian winter. A furious storm broke upon us just as we were leaving Bergen, and for all the five hours of our journey the wind howled about the little cars, patently checking our trivial speed when it caught the locomotive full in front in the rocky defiles, and making us tremble uncomfortably as it shot broadside upon us. There was no keeping the doors of the corridor car shut. As for the cold, in spite of the blazing stove, it was very great. Though we could roast our toes, the freezing wind took us in the back and at the sides, and each new incomer brought with him an arctic draught as he shook his shaggy coat free from snow and icicles and stamped hard upon the floor.

'Bad weather!' said each traveller, with emphasis rare in the mouths of the laconic Norseman. There was no doubting it. The lakes we passed were a deadly black where they had not frozen and got coated with snow. The mountain tops of course were deep in snow; so was the railway track. And the rock-sides by which we glided so closely were draped with icicles of many colours, thick as an elephant's leg. Never had I seen such icicles. If only the day had been bright, they would have been a glorious spectacle. But it was a dreadful day—nothing less. If the old Vikings had many such days—as who can doubt they had?—it was proof of their rare stamina that they existed so robustly in the teeth of them, and of their shrewd good sense that they took to the sea and sailed south by the thousand for piratical exercises.

One could not but admire the splendid physique of some of these country Norwegians on this Saturday evening. They looked monstrous as they entered the car in their rough wolf-skin jackets, belted, with large deer-skin moccasins to their feet, and wearing caps of seal or wolf skin. But their faces glowed with a sort of physical pride in their ability to stand against these shocks of winter, and their voices were musically resonant. Without exception they were blue-eyed. In Bergen one sees plenty of gray and hazel eyes. But then Bergen is in its way quite a cosmopolitan seaport, with a mixed breed of inhabitants; whereas here in the country the people still, as in the old days, mate with their neighbours, about the origin of whose stock there can be no question.

Vossvangen at last. We alight in a penetrating shower of fine snow, and darkness almost as penetrating. It is nine o'clock: the winter's night is already four or five hours old. The air feels exceedingly keen. Two or three lamps

glimmer among the few passengers and railway officials, and there is a murmur of speech. The sound of a sledge grating on the platform is heard before the sledge itself is seen. The next moment, however, a burly shape mantled in a fur coat and with a horn slung at its waist bustles forward. It is the mailman—one of the representatives of a class of Norwegians who in the winter have no little hardship to endure. He has a revolver on his hip. It may in extremity help him to withstand a couple of wolves, an infuriate bear, or (an even rarer peril) an unscrupulous fellow-countryman; or it may serve to give the *coup de grâce* to his horse if anything should happen of a very bad kind. The jingle of bells a moment later announces the mailman's departure with the letters. The wind howls and the snow whirls under the station cover. Truly a wild night, if you add twenty degrees of frost to its other engaging features. Yet, when we get outside, piloted through the drifts by a lad with a lantern, there is a glimmer of stars far, far away; and an instant afterwards the silver curve of a baby-moon declares itself magnificently from behind a great dark mass that must be a mountain.

'Bad weather now, but a fine to-morrow,' observes our guide with a slow sententiousness that tells of his consideration for us as strugglers with an unfamiliar tongue.

Never was a boy's weather-wisdom more superbly proven. Yet long ere we were in bed the portents had grown black as Acheron again. Sitting in the snug little parlour of the inn and wrestling for intelligible speech with the kindly landlady, who seemed to think it due to us that she should sit with us and make remarks at the meaning of which we could only guess as a rule, we heard the storm-fiend at work again. Such frantically discordant music as it favoured us with, I, for one, never wish again to listen to. A week of it would make the best of men an incurable maniac. There we sat, however, with our feet on the stove, smoking cigars, and drinking the punch our good dame insisted on mixing for us. She had given us ptarmigan for supper, at which we had rejoiced; and her husband—a lean subtle-eyed gentleman, who combined shop-keeping with the position of landlord of two inns, and who had—as we understood it—promised to outfit us in the proper Norwegian mode from his own store on the morrow—brought us his visitors' book, as if to emphasise the difference between Norway in August and Norway in the first week of January. The good man assured us by speech and gestures that in summer he filled two houses and a half with his guests. Now, however, the house and a half were absolved from all tax of hospitality, and of the remaining house we were the sole guests.

In going up-stairs to bed we trod into a snow-drift on the landing. Double windows had been unable to keep out the enemy. However, thanks to an excitable little stove, our room was warm enough for a Brazilian orchid; and ere getting into bed, we loaded it with pine-knots, so that the roaring of its flames in the chimney quite outvoiced the howling of the wind.

A pallid blue sky, clear as ice, greeted us when we turned out at nine o'clock the next morning. The gray wooden houses of the village looked

pretty in their snow-mantle. So did the villagers, ploughing through the snow of their thoroughfares—it was three feet deep at the least. So, too, did the Vossvangen lads, muffled to the ears by their discreet mothers in home-made comforters, as they shouted to each other to come out upon the hill-sides behind the village and enjoy a bout of snow-shoeing. There were divers enthusiastic collie and retriever dogs with the lads. These barked and rolled each other in the snow. It was evident they enjoyed it.

Then the sun stole over a mountain-top, just as the slip of a moon had done the evening before, and the valley was transfigured. The great lake was already frozen all over and dazzling white in its spotless counterpane of snow. The hill-sides, thick with pines, were a beautiful study in black and white, above which the cloudless blue of the heavens momentarily gained in intensity, so that at length we might have thought Norway had for the day borrowed her sky from Italy. While we breakfasted, the jingle of bells outside grew constant. One sledge after another shot into the village from the various homesteads which dot the slopes of Voss. They were not drawn by reindeer, but by those very independent and sturdy little ponies which summer travellers in the land know so well. Each sledge carried a family party, and very odd some of these parties looked, the women swathed in woollens, so that little except their rubicund frost-coloured noses could be distinguished; and the bright blue eyes of the maidens sparkling from the semi-obscurity about them. The church bell tinkled hardly more sonorously than the sledge bells; and group by group the sledgers and village folk entered the porch. They were fair to see for the variegated colours of their woollens—quite a tulip bed, in fact; and afterwards, when the cloaked sound of their responses inside the holy building could be heard, a man of felonious instinct might have carried off a hundred or two of pairs of clogs and galoshes, with which it is the vogue in winter to litter the church porches.

Our worthy host did not belie himself. When service was over, he took us into his store and compelled us to buy Scotch galoshes and German-made gloves, as well as other articles which were, he said, quite indispensable for our journey. This done, and the day continuing glorious—with the echoes of the happy shouts of the snow-shoeing boys and dogs reaching us from far up the valley—the sledges were brought to the door; and having been zealously muffled in our fur coats and bearskin knee wrappers, we left Voss amid the loud 'Godspeeds' of both our entertainers. The apothecary and the people at the post-office looked from their windows to see us pass; else we did not seem much to rouse the curiosity of the villagers. I do not think, however, that the Norseman is troubled like men and women of the south with the itch of inquisitiveness. There is much in the climatic phases which surround him that he cannot understand: Nature is nowhere as here so mysterious, alternately caressing and striking hard with clenched fist. Without a trustful faith the Norwegian would be the most wretched of individuals. His forefathers were stout fellows, with a firm belief in the pleasantness of Odin's im-

mortal banqueting halls. He for his part is just a simple sort of Christian who looks as far as possible on the bright side of life, and believes in Paradise. Like most sensible mortals, he takes short views, though at the back of all his hopes is the predominant faith in heaven as the reconciler of such vague doubts about terrestrial existence as may at times possess him, and the complete and satisfying atonement for his earthly troubles. He is far from being effusively religious or regardful of externals. Like the bear of his native land, he is somewhat phlegmatic and torpid during the winter; and, again like the bear, he is not an enemy to be despised. But whatever he is or is not, he is singularly devoid of the kind of curiosity that in America urges a man to put his fellow-man to the question as if he were a cross-examining advocate in a law-court.

Our sledges were light gay little affairs of iron and brass, each with a sort of bicycle saddle behind, upon which the driver sat with one foot on the runner, to serve as an accessory rudder. The official road-clearer—a triangular shape of wood drawn by the apex—had been abroad that morning and made a capital way for us. Up hill or on the level we went well; but downhill we seemed to go on the wings of the wind, with a furious clatter of bells and a nodding of the shaggy heads of our steeds that it made us giddy to watch.

Cold of course it was, in spite of fur coats, double gloves, and reindeer overshoes. We felt it most at the toes. After an hour, the nipping became very painful. A numbness succeeded; and when, having journeyed for two hours, we halted at a bright little *châlet*, the inn and post-house combined, for a moment we staggered as we tried to walk in the orthodox way. However, a couple of armfuls of hay put matters on a better basis for us in the subsequent journey; though a mysterious sort of ill humour that took us at times was distinctly traceable to these effects of the weather upon us.

It was an enchanting afternoon, and the scenes through which we passed were also akin to those of enchantment. Not a breath of wind stirred save that which we created in our brisk movement. The whole land was blanketed in snow. It stood eight and ten feet deep by the road-side, and the stones in the river-bed showed more than a yard of it upon them. Only the vertical face of the great rocks beneath which we glided was free from it. But in compensation there was here the fairest conceivable decoration of icicles. They hung by the fathom in broad parallel lines, and were of many hues, from brick red and purple to sea-green, turquoise, and silver gray. Some of them were pendent above us like the portcullis of an old castle, and we could have fancied the mere concussion of our horses and cars would shake them fatefully upon our heads. Of waterfalls there ought to have been great store along this road. In the green summer days and the bright summer nights their song is here a continuous lullaby. But now they were all silenced. Jack Frost had nailed them hard and fast to the rocks. It was magnificent to see the monstrous rigid masses frozen in waves that overlapped each other, each lap fringed with great variegated icicles.

At the inn where we tarried to ease the horses and imbibe hot coffee, while prowling round its precincts I came upon a lemming. The little rat-like creature stood on its hind-legs and barked in a babyish but very frantic manner at my legs. I could of course have crushed it to death with my foot. But this, equally of course, I forbore to do. The little animal was being plagued quite enough by the winter. It had wandered hither in search of food. Perhaps it was a herald of an entire army of its little fellow-mortals, which sometimes traverse the land in solemn procession tens of thousands in number, stopping at no obstacle, whether it be a fire, an arm of the sea, or even a boat with rowing-men in it which happens to intersect their line of progress. Their coming and going is inexplicable to the Norsemen, who have many strange notions about them.

Again wrapped up and stretched mummy-wise as to our lower extremities, we enjoyed the brief afternoon sunlight. The sun soon got behind the mountains, and as suddenly the air seemed to double in chilliness. It was wonderful how sombre our surroundings became all at once. The river, where it was unfrozen, was like a stream of ink, contrasted with the ineffable prevailing whiteness. And the dark faces of the cliffs seemed to lour menacingly. Above us, however, a few bright lines of crimson and gold told of the sunset elsewhere; and the coral glow about the snowy summits of the high mountains in the west was almost intense enough to warm us.

We passed one more inn ere the night wrapped us round. It was fast closed for the winter. A couple of magpies scurried across the road near, towards a pole, to the top of which the kindly peasantry had affixed a sheaf of oats. Then we plunged into a pine-forest, every twig of every tree in which was heavy laden with snow and icicles; and for half an hour sped through this eerie twilight scene in a silence that was almost sensational. Ere we were through it, the stars had begun to beam above the tops of the trees; and when we were again in the open, the great smooth space of a lake two or three miles square was to our right, with starlit mountains on the farther sides.

Even to us Britons, it was a great experience, this solemn, beautiful freezing progress through the land. Nor was my driver without his feelings of pride in his native country in its winter dress. 'It is cold,' he observed twice in my ear; 'but lovely—is it not?' You would not have thought this great red-bearded, massy-shouldered carl had a care for the picturesque. But it was evident he had a very strong appreciation of it.

Another hour passed, and then we rose amid the mountains. The stars had brightened amazingly in the meantime. But they only served to emphasise the tremendous gloom of the black defile in which we found ourselves. An icy breath of wind whispered down this ravine, and almost suspended the heart's action for an instant. Then suddenly a lamplight shone strongly before us. Our ride was at an end. Voices were heard above the music of our bells, which latter had twice or thrice set me dozing; and our welcome reached us from afar. The warmth of the house after the thirty degrees of frost through which

of late we had been driving, fairly made us pant while we were being helped out of our clumsy furs.

If you do not know what a Norwegian welcome in winter means, you cannot have a just idea of the Norseman's character. There was a household of people here, and yet one and all seemed consecrated to our service. Having first drunk off a glass of fine Cognac, we were taken straightway to the drawing-room, where cards and music were in full swing. A Norwegian Sunday allows these diversions in the evening. There could be no question about that, for there, taking his hand at whist, and having his glass of punch replenished oftener than any one else, was the pastor of the parish—a hearty old fellow, who drank loudly to us as soon as we were announced, and who later lost a crown or two to us at the cards with perfect serenity. Some people fancy the Norseman sleeps through the winter—or rather spends twice as many hours in bed during the short days as in summer. It is an error. Midnight came and caught us still at our pleasure. But by this we travellers were drowsy to the last degree. And so, to a chorus of 'Sleep well,' we set the example of retiring to our snug rooms, lit by the glow of the resinous pine splinters in the stove.

THE VALLEY OF SHEITAN.

A STORY OF THE BHORE GHÁT INCLINE.

IN TWO PARTS.—PART II.

THE settlement of Lonauli round about the station at the head of the Bhore Ghât Incline has occasioned a pang of home-sickness to many an exile from the old country, wearied of teeming native cities and red-taped military cantonments. It is the only purely English village in all the vast peninsula. Here may be seen the trim cottages of the humbler railway employees, each with its bit of garden-ground; and here it is possible on occasion to walk a good half-mile and meet never a Hindu or Mohammedan, but only good honest Britons, whose working-clothes and grimy faces bewray them as toilers for a weekly wage. The pretty Gothic church, the tiny post-office, a genuine English grocer's shop, and last, but not least, the Railway Hotel, complete the picture of home-life. Away on the outskirts, removed from the daily and nightly roar of the engine, and sheltered by magnificent groves of mangoes, lie the white-washed bungalows of the higher officials.

Lonauli is the rural Crewe or Swindon of the Great Indian Peninsula Railway. It is here that the locomotive works are established, giving employment to some two hundred Europeans; but the white population is increased by the wise foresight of the company in choosing this healthy site on the edge of the great Sahyadri range as the residence of their travelling servants. Engine-drivers and guards in goodly numbers inhabit the better class of cottages in the village, or rather their families do, while the bread-winners are away up the line to Madras or down the Ghât to Bombay in charge of the 'arg-gari'—the mighty 'fire-carriage' which is fast civilising India.

In a neat little bungalow a quarter of a mile

from the station, James Hudson and his daughter Sibyl were seated at breakfast. No one, to look at the upright handsome elderly man, would have guessed the nature of his employment; and Sibyl would certainly have been placed higher in the social scale than the rank she filled. The surroundings, too, were out of keeping with the position occupied by the head of the house. An open piano by a good maker stood in a corner of the room, and there were books—French, German, and Italian, as well as English—scattered about in profusion.

‘I have heard from Mr Heygate this morning, father,’ Sibyl was saying; ‘he is coming over from Poona to say good-bye. I am so sorry it is one of your duty-days; he would have enjoyed a chat with you, and now you will not see him before he sails for England.’

Hudson looked up and scanned the girl's face intently before replying. Then he said: ‘I do not think he will miss me much to-day, Sibyl. —Tell me, my daughter, and tell me truly, has this young man's coming amongst us meant more to you than the making of a pleasant acquaintance whom in six months we have both grown to like? Does his departure mean more than the departure of a friend?’

The guard got his answer from the tears which he saw were very near Sibyl's eyes. ‘I—I hardly know, father,’ she said; ‘three months is such a long, long time. I am very sorry he is going away—and I think he is sorry too.’

‘He has not spoken to you, Sibyl, has he—in a way, I mean, that would make a great change in my little girl's life?’

‘No, father; there have been no words of that kind between us. Mr Heygate has always treated me as a gentleman should treat a lady; but’—and Sibyl stammered painfully—‘I have sometimes wondered whether in his heart he does not remember that we are only railway people after all. Now that his elder brother is dead—it is that which takes him home, you know—he is heir to the baronetcy.’

Hudson thought deeply for some time without replying; then he rose and went to a small side-table where there were writing materials, and wrote rapidly for a few minutes. Having placed what he had written in an envelope and sealed and addressed it, he handed it to Sibyl, saying: ‘There, dear; give that to Mr Heygate when he comes. I should like to have seen him and spoken to him before he sails; but that is impossible, as I have to make the long trip to Madras, and shall not be back till the day after to-morrow. He leaves Poona for Bombay by to-night's mail, does he not?’

‘Yes, father,’ said Sibyl. ‘He is going back to Poona after he has said good-bye, and will pass through the station here about midnight on his way down the Ghât to Bombay.’

‘Well, tell him I was sorry to have missed him, and give him my note. I hope my little girl will find everything come right, just as she wishes—now,’ said Hudson, with an involuntary pause before, and emphasis on, the last word which made Sibyl start.

‘Oh father!’ she said reproachfully, ‘surely, surely you have not mentioned me in the letter?’

‘There is not a word about you in it, dear,

on the honour of an—— I mean, on my own honour,’ said the guard, pulling himself up rather lamely. ‘And now I must be off to the station. —Good-bye, Sibyl; God bless you, now and always.’

Hudson kissed his daughter, and left the room by one of the windows that opened on the veranda; but he had not been gone a minute when he returned. ‘That fellow Carnac,’ he said, ‘has he been annoying you lately?’

‘No, father. Why do you ask?’ replied Sibyl, looking surprised.

‘Only, because he passed the bungalow just now, and I thought he was miles away on day-duty down at the reversing station. He has got a holiday, I suppose. If he has given up his idiotic pretensions, though, it doesn't matter. Anyway, he wouldn't dare come to the house.—Good-bye again.’ And the guard hurried off to make good the lost time, leaving Sibyl to tidy the house before the arrival of her visitor.

Six months had passed since the adventure at the reversing station, and now she only looked back to it as the incident which had brought her Lionel Heygate's friendship. Luke Carnac, the half-caste pointsman, who before that day had annoyed her with his attentions, had made no sign since Heygate's iron grip had flung him aside. Sibyl had well-nigh forgotten his importunate wooing—a wooing which she attributed to the man's impression that his ‘Europe clothes’ entitled him to a ‘Europe’ wife, rather than to any romantic attachment to herself. When she thought of the pointsman at all, it was more with apprehension on Heygate's behalf than on her own; for on the day after he had attempted to take her hand at the reversing station, in order to press his suit, she had met him in Lonauli street, and he had whispered in passing: ‘Tell your fine friend from Poona that we Eurasian gentlemen never forget an injury.’ There was something so ludicrous in the man's assumption of European manners as he hissed out his implied threat, lifting the seedy felt helmet from his oily jet-black hair, and referring to himself as a gentleman, that Sibyl had laughed at the time. It was not till afterwards that she thought of the vengeful glare in Carnac's eyes, and wondered if he might plot some secret mischief. Open violence he would never dare; he was too much of a coward for that.

As Sibyl tidied the pleasant sitting-room, her thoughts turned to the impulsive young officer who had sprung, as it were from the jungle, into the very heart and centre of her none too eventful life. Often and often since that chance meeting Lionel Heygate had been a visitor at the guard's little bungalow—at first making the excuse that sport had brought him to the neighbourhood, but after a while, in no way concealing that he came on purpose, because he found pleasure in the society of both father and daughter. Poona, where his regiment was stationed, was only twenty miles along the line from Lonauli, so such visits were easy. Sibyl, fresh from the quiet school in England to which her father, stinting himself to provide education for his only child, had consigned her when little more than a baby, knew nothing of the world. Lionel Heygate was the only young man with whom she had ever been brought into close contact, and it was

perhaps in the nature of things that her heart passed out of her own keeping almost before she was aware of it. Of late, their relations had grown closer; Heygate had taken to calling her Sibyl, and his manner suggested a feeling warmer than friendship; but the all-important word had never been said. This was the position when, two days before, a hurried line had informed Sibyl that Lionel was called home on three months' leave, owing to the death of his elder brother; and now he was coming to say good-bye. Would he have anything else to say? she wondered. Was it not more than she could hope for? At anyrate, it was more than she, a railway guard's daughter, had a right to expect.

Then she fell to thinking about the letter her father had written. He had pledged himself that it did not mention her; but she dreaded lest it might have some indirect bearing on the secret he had surprised. She would die of very shame if there were anything in that letter calculated to force Heygate's hand. She knew that though her father chose to remain in India as a railway guard, he was by birth and education a gentleman. Was it possible that he had disclosed his past in that letter, to show Heygate that socially they were his equals? Sibyl was a proud girl, and she felt that even such an indirect hint as this would be unbearable.

However, she had promised to give the letter, and give it she must. She turned to the piano, on which she had placed it, and behold the question was solved for her, whether she would or no: the letter was clean gone! High and low did Sibyl search amongst the music, behind the piano, everywhere; she felt in her pocket, in case she should have placed the letter there without thinking, but all with no result. It had vanished as completely as though it had never existed. Only for half a minute had she been away in her adjoining bedroom, and yet in that brief space some one must have entered by the window and stolen the letter. Their one Portuguese servant was not in the house at all; he was gone down to the bazaar to buy fruit; and, besides, Pedro was an old and faithful servant of her father's. Had he been there, she could not have suspected him.

Sibyl went out into the veranda and looked round the compound. There was only an old Hindu of the 'Mehteh,' or sweeper, caste to be seen, busy about his work in the far corner. He was not the usual sweeper who attended the bungalow, Sibyl noticed; but she could not suppose that the ragged scavenger had abstracted the note. Then suddenly she remembered that Luke Carnac was off duty that day, and that he had been seen passing the bungalow. It was just possible that the pointsman might have been prowling about and had got the letter. She called to the old sweeper, and asked him, in imperfect Hindustani, whether he had seen any one in the compound. He merely raised his hands to his dirty turban, stooping the while in deep salaam, and shook his head. There was no information to be got in that quarter, evidently.

As Sibyl was hesitating what to do next, a quick step sounded on the road, and Heygate turned in at the compound gate. Sibyl advanced to meet her visitor, for the moment dismissing

the letter from her thoughts, and half glad, perhaps, that some mysterious influence had made its delivery impossible. Side by side they returned to the bungalow; but after the first greetings, neither spoke till they had passed into the cool sitting-room, now so familiar to both of them. And then is there need to tell what followed? Half-a-dozen words settled everything, as half-a-dozen words are wont to do when a young man has found out that he knows his own mind and a maiden's heart is touched. Before they had been there two minutes, Sibyl was shedding mingled tears of joy and grief on Lionel's breast—of grief that he must leave her for a while; and of joy that, when he returned, it would be to claim her as his bride. This is no story of love-making. Let us step out on to the veranda while these two pledge over again the vows which have been pledged so many million times before.

But if we have no desire to listen to lovers' talk, some one else has, it would seem. What is that crouching figure doing outside the 'cuss-cuss tatty' which veils the window? The tattered red turban is bent close to the wall; one dusky hand is thrust into the folds of a filthy cummerbund—as if to make sure that something concealed there is still safe—while the other hand is clenched on the upright post of the window-frame. It is the old sweeper, who a moment ago was busy about the compound, converted into a stealthy eavesdropper, and with a vengeful glare in his eyes wonderfully like that of Luke Carnac the pointsman. For a full half-hour the crouching figure remained at the window, and then crawled snake-like along the veranda and disappeared.

Inside the room the time passed all too quickly, and the moment came for last words to be said. Lionel had to get back to Poona to make his final preparations before starting by the night-mail.

'I shall be passing through Lonauli to-night while you are asleep, Sibyl,' he said. 'I shall feel inclined to get out of the train from sheer force of habit. But at anyrate I shall have the satisfaction a little later of seeing the place where we first met.'

'The Ghât will look grand to-night in the full moon,' said Sibyl. 'I have not been at the reversing station since that day; father does not like me to go so far alone now.'

'I should think not indeed, with that creepy-looking pointsman about,' said Heygate. 'By the way, I should not care to make the journey down the Ghât if he was at the points and knew that I was in the train; but that is impossible, of course.'

Sibyl looked thoughtful for a moment before she replied: 'Yes; he could not know; besides, he is on day-duty now; he has a holiday, too, father said.'

Then there was a gentle leave-taking, and Sibyl was left alone to her dreams. It was not till she was awakened by the entrance of Pedro with her modest tiffin that she remembered that she had not mentioned her father's letter and its mysterious disappearance to Lionel. She was rejoiced that he had spoken without receiving it; but still she was annoyed at having forgotten to tell her lover of its existence. Perhaps, after

all, it was only an ordinary farewell, and would not really matter.

Suddenly the startling reflection flashed across her mind that her father might in his letter have alluded to Heygate's departure by the night-mail. If her vague surmise that Carnac was the purloiner were correct, the pointsman would be in possession of the very information she would most have desired to keep from him. What was to prevent him from arranging to go on duty that night with a view to promoting some terrible catastrophe? Sibyl trembled at the thought, and her dread was aggravated by the knowledge that she was absolutely powerless. She had nothing but a vague alarm to combat; and even if she knew for certain that Carnac was to be in charge of the points at the reversing station that night, there was nothing to justify her in speaking to the station-master at Lonauli. To that official she was but a guard's daughter, and he would laugh in her face at such an unwarrantable interference.

One thing she could and would do: she must know who was to be pointsman at the top of that awful precipice when her lover's train passed down the incline. Sibyl quickly made her way to Lonauli Station, and sought out a foreman of platelayers to whose wife she had done many kindnesses. The man happened to be in the tool-shed, and gave her his attention at once. The information she wanted was not in his department; but he knew where to obtain it, and quickly returned to the shed, where Sibyl waited for him.

'The pointsman at the reversing station to-night should have been Simmons, Miss Hudson,' the platelayer said; 'but he has exchanged his turn, and his duty will be taken by Luke Carnac. Carnac goes down by the 6.40 from here, and will not come off till six o'clock to-morrow morning.'

It was as she feared, then! Sibyl went back to the bungalow and sat herself down to think. Hour after hour went by, and she could come to no determination. She did her best to persuade herself that there were no real grounds for apprehension, and she went about her usual occupations in the hope of stilling the anxiety that had taken hold of her; but ever and anon there recurred the vision of the yawning abyss—the terrible Valley of Sheitan, between which and her lover's safety would stand but the jerk of a lever entrusted to the hands of his deadly foe. If only her father were at home!

The afternoon waned into evening. Sibyl heard the whistle of the 6.40, and knew that Carnac had gone to his post. Eight, nine, ten o'clock passed, and still Sibyl sat on, unable to retire for the night with any prospect of sleep, and yet undecided what course to take. At last, when the clock had struck eleven some time, she could bear the suspense no longer, and determined to go down to Lonauli Station, and then be guided by circumstances. The mail-train by which Heygate was to travel was due at Lonauli at 12.10, and stopped there ten minutes to change engines before starting again on its journey down the incline. It was just possible she might summon up courage to speak to the guard or the engine-driver, at the risk of being laughed at for her pains. It never crossed her mind to

speak to Heygate himself. Though he had half jestingly alluded to the possible consequences of the pointsman being on duty, she knew that the young soldier would be the last to be influenced by any real fear.

Pedro had retired to his hut in the compound long ago, so Sibyl left the bungalow unobserved. The full moon had risen, and all the landscape was bathed in a soft mellow light. The stately palm-trees, the groves of mangoes, and the white buildings of the sleeping village stood out clear as by day, casting long shadows across the silent street; while far off the jagged peaks and bold escarpments of the Ghât, glistening white in the pale beams, marked the descent of the great range into the valley below. It was even possible to trace the course of the railway line, here running threadlike along the brink of a mighty chasm, and there plunging into the bowels of the earth to reappear on some lofty viaduct, but tending downwards—ever downwards towards the lonely plateau where Luke Carnac stood at the levers waiting for the approach of the mail-train.

In five minutes Sibyl was at the station. Looking at her watch, she saw that it was just midnight—ten minutes before the train was due. Again and again she tried to nerve herself to enter the station and lay her fears before the station-master, but again and again she saw that she had no case. How could she explain, except by saying that she was engaged to Mr Heygate of the Westshire Regiment, who was in the train, and that she had refused the half-caste pointsman who was on duty down the incline; that because of this complication she was positively certain that the pointsman would wreck the train and kill a hundred unoffending passengers. She would be the laughing-stock of India, in the event of the train going down in safety; and what was worse, her lover would have to share the ridicule. And yet—

While this was passing and repassing through her mind, Sibyl had wandered into the locomotive yard, which was situated on the side of the station nearest the commencement of the incline, and consequently farthest from that which the train was approaching from Poona. Suddenly her eyes fell upon a trolley—one of those miniature trucks which platelayers use for transporting themselves and their tools from one part of the line to another, and which are propelled on level ground and up-hill by lever-power, and down-hill by their own weight. The inspiration came to Sibyl like a flash, and as quickly was her resolution taken. She would go down the incline in the trolley to the reversing station, and herself ensure by her presence the safety of the train. With a witness standing at his side, Luke Carnac would not dare the perpetration of a great crime. For after-consequences she cared nothing; her action would be accounted for as a girlish freak, and she could go on in the train to Karjat, and return at the first opportunity.

The trolley stood on the metals close to the main line. Luckily for Sibyl's project, the engine which was to be attached to the train was getting up steam inside its shed, whence the driver could not see her. Otherwise, the yard was deserted. Cautiously she pushed the trolley on to the main line, and, to her satisfaction, found that it ran

quite easily. When she had gone a hundred yards, the ground began to dip at the commencement of the incline, and the trolley no longer needed assistance. Giving it a final push, Sibyl sprang on, and began her journey. As she did so, a whistle far away to the rear heralded the approach of the train to Lonauli, and told her that she had a little over ten minutes' start.

Soon the trolley gathered speed as the gradients grew steeper, and Sibyl found herself flying along the dizzy track at a breakneck pace. One moment she was whirling along the brink of a sheer precipice over which a stone dropped would have fallen five hundred feet without meeting an obstruction; the next she was rounding a sharp curve which suddenly plunged her into the resounding gloom of a tunnel, only to come rushing out into the moonlight a moment later high up on an archway spanning some rock-riven water-course. At last two-thirds of the distance was passed; and after another curve and a short tunnel, the trolley would shoot out on to the narrow cornice-like ledge that approached the reversing station. Sibyl looked back as she entered the last tunnel, and high up the mountain side, not two miles behind, she saw the glare of the engine coming down the incline in hot pursuit. Then and then only did the thought of possible danger to herself, and of the consequent failure of her purpose, strike her. Horror of horrors! if Carnac were in truth plotting mischief, she herself would be the first victim, and would be powerless to save the train. She was ignorant that there was a brake apparatus on the trolley which would have stopped it at will. Supposing the half-caste had fixed the points so as to connect the main line with the siding, the trolley would to a certainty go over the horrid brink.

Down at the reversing station Luke Carnac stood with his hand on the switch, gazing up the moonlit track towards the mouth of the distant tunnel where the mail-train would appear. With a ghastly smile on his swarthy features, he pulled the lever which connected the line with the fatal siding instead of with the level ground of the reversing station. Then, still chuckling to himself, he set the signals at 'safety' and waited for his revenge. The man was half-mad with rage and jealousy, and recked nothing of the fearful catastrophe he was about to cause. What mattered it to him so long as the mangled form of Lionel Heygate was among those relics of poor humanity which another five minutes would send crashing down the mountain side!

Suddenly a faint rumbling in the distance told his practised ears that wheels were approaching along the metals. But not a train, surely! The heavy mail-train would make more noise than that. Ten thousand furies, what could this mean? What strange combination of circumstances was this? That was no train, but only a trolley speeding down the incline towards him, and on it surely that was a woman seated—a woman waving her hands and crying out wildly unintelligible words. By all the powers of darkness, it was Sibyl, come to see her lover die. *She* must not be sent over the precipice—not yet, at least—her presence there would double the sweetness of his revenge.

Carnac caught hold of the switch just in time

to divert the trolley from the siding and send it spinning merrily along the level of the reversing station, where it would come to a stand-still in a hundred yards. So soon as it had flashed past him, he ran as hard as he could in its wake. At all hazards he must tell Sibyl of his project, so that she should miss none of the agony of anticipation, and he might the better gloat over her distress. The trolley ran nearly the length of the reversing station before it stopped, and he had only time to pant out, 'I am going to send your lover over the cliff,' when a loud whistle told him that the train was approaching. In a second he remembered that in his excitement he had omitted to replace the points after turning the trolley into the reversing station. Unless he could reach the points in time, the train would glide safely on to the plateau, and his revenge would be lost to him.

That was a wild race between the man and the train. Straining every nerve, Carnac rushed towards the switch, but the ground in the six-foot way was rough and stony, and he had to cross the line in front of the advancing train. As he sprang across the metals, with hand extended to grasp the lever, his foot slipped, and the engine was upon him. Crushing the fallen body as if in scorn, it went clanking and snorting over the points on to the safety of the plateau. Luke Carnac's plot had failed.

The letter which Hudson had written to Heygate was found on the dead man's body. When the train went on again, Sibyl accompanied her lover to the station at the foot of the Ghât, and she watched him curiously as he read the missive which had been instrumental in saving his life. When he had finished, he handed the letter to Sibyl, and this is what she read:

DEAR LIONEL—As you are about to return to England, I think it is due to you, after our very pleasant intimacy, to know who I really am. My name is James Heygate; and I am your father's first-cousin, his grandfather having been my grandfather also. You will oblige me by conveying my kind remembrances to your father, Sir Gerald. He will remember the circumstances which led to my adopting my present mode of life after the unfortunate duel at Madras. The world acquitted me of blame; but I could not forgive myself for the consequences of the quarrel that was thrust upon me, and I have therefore effaced myself. I have no desire to change my condition now, and I beg of you not to let this go beyond the family circle.—Wishing you a safe voyage and a speedy return, I continue to sign myself yours,
JAMES HUDSON.

'So you see I am really your second-cousin, Sibyl,' said Lionel; 'and your father is the Captain Heygate who mysteriously disappeared so long ago. I remember the story well. He was, as he says, dragged into a duel with a quarrelsome brother-officer, and killed his man. But his remorse would not allow him to remain in the regiment, and he has not been heard of till this day.'

Sibyl sat silent, for she was thinking how glad she was that Lionel had not seen that letter till after he had asked her to be his wife. It was better, far better, to have been wooed and won

as Sibyl Hudson, the guard's daughter; though she rejoiced that her birth would not now be a source of reproach to her husband's relations.

But above all she was thankful that the letter had been written and afterwards abstracted, because otherwise she would never have supposed that Carnac knew of her lover's journey to Bombay, and the fears which led her to interrupt the pointsman in his fiendish work would never have been aroused. As a matter of fact, Carnac had obtained his information from a half-caste friend in Poona—not, as will have been seen, from the letter—and had laid his plans the day before. But this was not ascertained till after Lionel had returned to India, bringing the congratulations of the family to his bride—the bride who met with a warm welcome from those stern autocrats, the 'ladies of the regiment,' as the Heroine of the Incline.

NOTES ON BOARD A MAN-OF-WAR.

ON a Monday morning in the spring of this year I was in one of Her Majesty's powerful ironclads, lying in a large harbour in the Mediterranean. It must have been about five A.M., and I was turning round for a final nap, when my half-awakened senses were invaded by the cry: 'Hands abandon ship.' Still half asleep, I at first thought that some fearful mishap must have reached us, and it was not till I heard a knock at my cabin door and a voice saying, 'They've piped it twice, sir,' that I was reminded that this early hour had been fixed on for exercise in the rapid carrying out of what would be necessary should such an emergency arise as in my dreams I had pictured. Slipping on my clothes, I hurried on deck, my ideas not yet quite clear, with visions running through them of the ill-fated *Birkenhead*, and the gallant red-coated band on her decks, steady as on parade, 'presenting arms' as the ship made her final plunge—and found the work of getting out the ship's boats in full swing, the engine rattling away as each was raised from its cradle and lowered into the water alongside, to be at once taken in hand by a portion of its crew, who rapidly and without confusion provide the stores and provisions—lanterns and candles, spirit-breakers, boxes of biscuits and tinned meats, 'boats' bags,' with small articles for boat's use, and pass them into the boat, while the coxswain examines his water-breakers and sees them filled with fresh water. A carpenter and a signalman, the one with his tools, the other with his flags, get into each boat. The paymaster, with his assistants carrying the bags of gold in his charge, joins those officers whose duties do not call them elsewhere in the principal steamboat, which has got in its coal and water already and has steamed up; and the Medical Staff follow the sick, who on the first sound of alarm have been passed in their cots into the roomy cutter told off for their use.

All being ready, the word 'Clear ship' is given; and each party, rapidly mustering on deck near its appointed boat, passes out of the ship, which is left, noble and deserted, denuded of every sign of the teeming life on her decks ten minutes before. The last to go over the side is the Captain, who takes charge of this little army

let loose upon the waters, and from his galley inspects as they go by him the long line of boats with their complement of over five hundred officers and men, most of whom, twenty minutes before, were unconsciously asleep in their hammocks.

The next morning I was again fated to be roused at an early hour, though a little farther from the middle of the night than the day previous. As I was thinking whether it was not time for me to turn out and wondering why my bath was not set out in its accustomed place, the wild clang of the firebell, followed by the bugle call to attention, and the announcement, 'Fire in the engine-room flat,' came on my ears. To tumble on a few clothes was the work of a moment; but by the time I emerge from my cabin, half the men are at their stations, hoses are screwed on, branch-pipes are fixed, hatchways and watertight doors closed, and all communication with the seat of the supposed fire cut off; while in another minute a couple of hundred men are forcing round the pump-cranks and the water is pouring out through the hoses. The spirit and store rooms have been locked, their keys taken in charge by a responsible officer, and sentries posted on them and on the ship's boats; and in two minutes every powder magazine in the ship would have been full of water if required.

That same evening I was to have another surprise—my first experience of night-quarters, or general call to action at night. Midnight had just struck eight bells of the first watch, and I was sitting in my cabin in 'pyjamas' and slippers finishing off my daily contribution to the bi-weekly budget sent home, and thinking of laying my head on the pillow, when there rang out on the still night-air that portent call to arms, the thrilling 'Action' bugle. When I get to the battery deck I meet the half-awake sailors and marines, running along in bare feet with their lashed-up hammocks under their arms, to be put away clear of the working of the guns. Electric lights are got ready and turned on, guns cast loose, ammunition brought up from below, big guns in their turrets whir round to where the search-light shows the advancing enemy. In ten minutes from the first alarm, when men were asleep in their hammocks, every gun is loaded and on its required bearing, and the ship is completely prepared for fighting. The exercise being over, fighting gear returns to its normal repose, hammocks are brought out again and unslung, and we adjourn to the wardroom, command sardine sandwiches—the dish *de rigueur* on such occasions—from the sleepy steward, and with a little refreshment of a fluid nature to assist, fall to discussing the delinquencies of our sister-ships in the fleet, while each present endeavours to explain how by a mysterious intuition he himself, if no one else, was quite certain all the evening that on this particular night this exercise would be practised, and that it was no surprise to him—oh, no!

But after so much work, a holiday. Thursday afternoon in the British navy is the sailor's half-holiday. On that day no work is done on board from noon till after supper at five P.M. The commander ceases from troubling and the blue-jacket is at rest. Men can do as they please the

afternoon through, and the smokers have their wicked will, the smoking lantern and the spit-kid holding their own, instead of being peremptorily removed at the close of the dinner hour; while the officer of the watch, paraphrasing Gray's lines, can say: 'The ship is left to stillness and to me.' Repose, indeed, has possession of the ship. The first-lieutenant to-day puts aside his soap and soda, and is content to leave in peace his army of scrubbers, while he thinks complacently over the morning's inspection of his snow-white decks and bright paint-work. The lieutenants of divisions forget their usual occupation of overhauling 'bags'—receptacles doing duty as cupboards and travelling chests for the seamen's kits, always to be kept up to service pitch—as, with kit-book and footrule in hand, they number the articles, seeing that everything is regulation size, with exact width of braid and depth of collar—calling from a sailor once the remark, *sotto voce*: 'When we say that we are in uniform, we deceive ourselves, and the truth is not in us.'

Officers sit about in easy-chairs, the latest paper or a novel in their hands, pipes between their teeth, eyes gradually closing. Hands below are taking a rare 'stretch off the land,' lying anywhere, in all attitudes, with a coat, an iron ring, a coil of rope for pillow, sleeping, reading, yarning to each other in low voices. All is peace—even the master-at-arms has one eye shut. Here and there the soothing hum of the sewing-machine is heard, or an industrious sailor is seen at work tailoring—cutting out, piecing together, and making up a pair of those roomy trousers, the width of whose extremities and tightness of upper region are the especial pride of the wearer; or an old hand is at work netting a pair of twine curtains, the ship substitute for those piece-rugs of variegated pattern beloved by the old soldier on shore. The voice of the bo'sun's mate is stilled between decks, and the buglers have laid aside their instruments, all but he of the watch, who with one hand always on his bugle, stands idly on his post, letting his thoughts wander to the home he left behind him when he enlisted under the Globe and Laurels, and the day when he promised to 'serve Her Majesty, Her Heirs, and Successors as a Marine for a period of sixteen years.' (Buglers enlist at fourteen years of age.) The engines alone will not rest, but steadily, monotonously, throb out their beat by beat as the ship glides on through the calm waters, adding mile to mile of her way.

And so the afternoon passes on. Men give a stretch, a shake, life once more appears between decks, supper is piped, and another week's work begins. The Thursday afternoon, or Make-and-Mend-Clothes-Day, as it is called, is a time whose sanctity is never violated, and whose repose is complete.

Each afternoon at sea the ship is hove-to and hands are piped to bathe; a boat is lowered, and the water is soon a seething mass of heads. In board again, a game of cricket or rounders on the quarterdeck winds up our afternoon. In this the gunroom essentially takes the lead. A net is rigged above the ship's side to prevent too great an expenditure of balls. Two buckets of sand are placed to receive the wickets, and a supply of bats and balls—the latter made during

the afternoon watch of twisted spun yarn—is provided. We pick up sides; and for an hour or two a wildly invigorating and enthusiastic game is kept up, additional zest being afforded by the many obstacles all over our cricket-ground, such as guns, hatchways, and windsails, which cause the same delightful uncertainty as to the final direction of a ball as is given by the pepper pot in a fives court. Besides the ordinary rules for the fall of a wicket, one additional is of universal acceptance—the batsman who shall hit a ball overboard is at once declared out—and, I may add, takes with him no small invective from the other players.

In the evening we have a dinner-party. The wardroom officers have requested the pleasure of the captain's company, and several officers from the gunroom have been invited to meet him. The guests are received with the ordinary salutations of shore-life: 'How do you do, sir?' 'Glad to see you, old chap.' 'Have a sherry and bitters?'—as if we hadn't all parted but a quarter of an hour previously, after having spent the whole day and the whole of many, many days before this in the closest of company. We take our seats; the chaplain says grace; dinner is commenced; the band plays its cheeriest melodies; and after the Queen's health has been drunk and coffee passed round, guests and hosts adjourn to smoke, play whist, listen to the band, or discuss the never-ending points of interest which naval officers manage to keep fresh even to the end of the close intercourse of a three years' commission.

THE MONTH:

SCIENCE AND ARTS.

A VERY important part of our naval defences is comprehended under the term 'Armour-plates,' without which our modern ships of war would be impossible. Hitherto, these plates have been made in this country of steel; but favourable reports from America of the new 'High-carbon Nickel Harveyised Armour' have recently induced our Admiralty authorities to test this new material. Messrs Vickers & Co. of Sheffield were commissioned to produce a nickel steel plate by the Harvey process; and the plate thus made was recently put to the test at Portsmouth. This plate, measuring six feet by eight feet, with a thickness of ten and a half inches, was fired at with different projectiles, five shots in all being aimed at different parts of its surface. The result justified the favourable reports which had previously been received concerning the new plates. The shots indented the metal, and either broke up or imbedded themselves in the armour; but not a single crack was produced. It is believed that some of our war-vessels, which by reason of the thinness of their armour are regarded as obsolete, may once more be regenerated by receiving a covering of the new material.

The inauguration of a telephone line between New York and Chicago, which has rendered conversation possible between two cities which are nearly one thousand miles apart, is an event worthy of being recorded. It is interesting to note that Professor Bell, to whom the modern science of telephony is chiefly due, was one of

the first to talk through this long line of communication. A photograph of the Professor in the act of talking to the receiver, surrounded by many well-known men of science, was taken by flash-light, and has been reproduced as an illustration in one of the New York journals devoted to things electrical.

The snow-sweeper is a very useful and necessary adjunct to the electric railways which are now becoming so common in the cities of the United States. The sweeper consists of a car to which are attached at either end revolving steel brushes, which are geared to the motor which drives the vehicle. The cylindrical brushes revolve at a rapid rate, and scatter the snow to the side of the line, leaving a clear track for the trains which follow. There is decidedly a want of something of the kind on our railways in this country, and it is easy to imagine that a device of the same kind to work by steam could be constructed without much difficulty.

Dr Peterson and Mr A. E. Kennelly have been carrying out some experiments at the Edison Laboratory, says the *Scientific American*, with a view to determine whether any therapeutic effects result from the application of magnetism to the animal system. Removing the armature from a powerful dynamo (its magnets being excited, we presume, by another machine), a dog was confined in the vacant space for a period of five hours. When the animal was set at liberty, he seemed to be not in the least affected, except that he exhibited much joy at being again at liberty. The next prisoner was a boy, who was also quite unaffected by the powerful magnetic field in which he was placed. From these experiments, it is assumed that the human organism is quite unaffected by the most powerful magnets known to science. Were it otherwise, we should probably have heard long ago of the effects produced upon the many hundred persons who are daily engaged in tending dynamo-machines.

Another great railway across Canada is in contemplation. The new road, which would be called the Canada Western Railway, would have a length of more than one thousand miles, and would open up thousands of miles of valuable grazing, timber, and mining lands. The cost is estimated at five million six hundred thousand pounds, and the promoters believe that the sale of lands adjoining the railway, together with the cash subsidy of the Dominion Government of six hundred and forty pounds per mile, would produce not far from double that amount. Possibly they lose sight of the circumstance, of which we have had so many painful instances of late years, that estimates for big engineering feats are untrustworthy.

One of the latest developments of the 'coin in the slot' device is an automatic railway-ticket selling-machine. It has for some little time been in use on the Berlin City and District Railway, and is said to give satisfaction to the public as well as the railway company.

British dairy-farmers will probably not be too well pleased to learn that the first instalment of this season's Australian butter has arrived in this country in fine condition, and that consumers are promised for the next four or five months a consignment of about one hundred tons per week from the antipodes. Experience shows that it is

not necessary to freeze the butter during transit, but that it will keep in perfect condition in a cool chamber.

A process of a very promising description has been patented by Mr Frank Shumann of Philadelphia by which he produces a material called wire-glass. The new material consists of a sheet of glass, in which in course of manufacture is enclosed a layer of wire-gauze. The metallic gauze is literally imbedded and hermetically sealed within the glass, and will stand any amount of rough usage without breaking. The new material can be made of various thicknesses, and in sheets of large size; and there is little doubt that it will prove a valuable substance for skylights, roofs of railway stations, horticultural buildings, and will find employment in a variety of ways. Windows made of the material will be burglar-proof, and will be resistant enough to stop the progress of a pistol bullet. The American Wire-glass Company of Tacony, Philadelphia, which has been formed to develop the new invention, hope, by the beginning of next year, to be turning out five thousand square feet of wire-glass per day.

An interesting paper is contributed to *Science* by Dr Gibbs, who has been making an inquiry into the food of the humming-birds of Michigan. These birds are not insectivorous, as has been supposed; and although the author thinks that they may eat insects if flowers be scarce, there is no room for question that their normal nourishment is derived from honey.

The hydrophone is an ingenious telephonic instrument which will give audible and visible signs of the approach during the night, or in foggy weather, of a torpedo boat or other hostile vessel, and has been designed for the protection of roadsteads and harbours. It consists of two parts, one of which is sunk at any chosen spot in the water, at a depth of from five to fifteen fathoms; the other part being on shore, and joined to its fellow by electrical cable. A vibratory apparatus is contained in the submerged part of the instrument, and this is of such a sensitive nature that it will move in sympathy with the pulsations of the propellers of any vessel within the radius of a mile. This device has recently formed the subject of experiments by our War Department at Portsmouth, and has been found to give satisfactory results. The inventor of the instrument is Captain M'Evoy, who hopes to employ it to warn vessels of their proximity to dangerous coasts, as well as for war-like purposes.

It is well known that a floral clock can be made by selecting certain flowers which close their petals with some approach to regularity at certain hours of the day. But a floral clock of another kind has recently been started at Paris. A circular plot of ground thirty feet in diameter forms the dial of this strange timepiece, and flowers are so arranged upon it in plots as to make the figures and minute marks stand out upon it as clearly as upon an ordinary clock face. The two hands which move over this highly ornamental dial are also covered with growing flowers from end to end, and motive-power is provided for them by means of a small turbine concealed beneath the ground.

In a paper recently read before the American

Society of Civil Engineers, Mr A. F. Sears compared the cost and efficiency of different motive-powers for street tramways. According to this gentleman, who has made a study of the subject dealt with, haulage by horses is the most expensive. Next in order comes electricity, where, in spite of all precautions, a large quantity of the steam generating power must run to waste. Cable roads come next in order of cheapness; but these are not recommended except for steep gradients, where often no other form of haulage is available. Lastly, as the cheapest, comes steam; but here there is the disadvantage that the engine is necessarily heavy, and has to bear the additional weight of fuel and water. Two other systems Mr Sears believes are promising—namely, engines moved by compressed air, and those actuated by steam 'from water charged at high temperature at convenient stations *en route*.' We are not aware that this last method has been brought to practical test; but with regard to compressed air, the system was tried for some months on one of the London tramways, but the cars have now been withdrawn, and the line is worked by horses. This looks as if the compressed-air method is less satisfactory in practice than it appears to be in theory.

Some months ago, when the last giraffe at the Zoological Gardens (London) died, it was reported that the animal could not be replaced until the Mahdists once more opened the Sudan. But it would seem from letters which a correspondent has communicated to the *Times* that the habitat of the giraffe is not so circumscribed as was imagined. The letters were written by Mr W. Ellerton Fry, at present enjoying a trip to the Victoria Falls of the Zambesi River, and he tells of having seen and met with the tracks of many giraffes. We may therefore hope that the giraffe houses at the Zoological Gardens are not destined to remain untenanted for long. A good specimen of the animal is worth about five hundred pounds, and this price is sure to attract the attention of hunters of big game to the district indicated in Mr Fry's letters.

The history of Arctic exploration is a record of heroism, self-sacrifice, coupled with dismal failure, and it is to be hoped that the new enterprise of Dr Nansen, of which he gave the details to the Royal Geographical Society a few weeks ago, has a better chance of success than previous attempts to reach the ice-girdled Pole. His scheme is a comparatively simple one. Starting next spring in a vessel specially constructed to withstand the pressure of the ice, he will endeavour to be carried across the Polar region by the current which he asserts is constantly running from the north of Siberia to Franz Josef Land. Drifting with the ice, instead of attempting to force a passage through it, he hopes to be carried in the needed direction. The only difficulty which he seems to anticipate will be to get within the influence of the current referred to. Dr Nansen's wonderful journey across Greenland has already proved his fitness for the undertaking, and all will wish him God-speed in an expedition of such hardship and danger.

A remarkable steam-launch, probably the fastest vessel of its class which has ever been

built, was recently destroyed by fire at Philadelphia. The measurements of this vessel were as follows—length fifty feet, beam six and a half feet, displacement four tons, and draught fifteen inches. Its engine was of one hundred and sixty horse-power, and its two-bladed screw worked at five hundred and fifty revolutions per minute. The speed attained by the launch was nearly thirty miles an hour, and its builders hope to replace it by another vessel of superior attainments in this respect.

The Director of the Meteorological service in Canada has in a recent Report urged upon the authorities the necessity for periodical inspection of the different stations under his control, and the instruction of employees in the use of the various instruments required. He points out that in Great Britain and Ireland the stations in communication with London are constantly inspected, and in that way kept in a state of efficiency—and that it has been proved here and elsewhere that only under such conditions can trustworthy and satisfactory results be attained. He urges upon his Government the advisability of devoting funds to this purpose.

At a recent meeting of the Field Naturalists' Club of Victoria, it was shown that rain-making experiments are not unknown among savage peoples; that is to say if a superstitious practice can be dignified by the name of experiment. Among certain tribes of Central Australia a belief prevails that droughts are caused by the swallowing up of all available moisture by a 'rain-devil,' and that the occurrence of rain can only be thereafter possible by the capture of the demon, who must be made to disgorge. In order that this evil spirit may be tracked without detection, the rain-maker is equipped with feather boots, so that his footfalls may be noiseless. A pair of these boots was exhibited at the meeting referred to.

Now that the electric light for domestic purposes has come within the boundary-line of things practical, every one is anxious to know its cost as compared with the forms of illumination it is superseding. Some information upon this important point is afforded by a Presidential address delivered last month before the Junior Engineering Society by Dr John Hopkinson. He estimates the initial cost of supplying a number of customers from a central station at eleven pounds per annum for every kilowatt—that is, for every unit per hour. After this installation the cost will not be very much more than one halfpenny per unit. This estimate is either wrong, or the companies who are charging their customers sevenpence per unit are seeking an inordinate profit. In one case in London the parish authorities have themselves undertaken to supply the district under their control with electricity, and the enterprise is said to be a successful one. In this case the price charged to consumers is threepence per unit.

An instrument called a Schisophone has recently been presented to the Paris Academy of Sciences by M. de Place. Its purpose is to afford indications of the existence of any unseen or internal flaws in a mass of iron or steel, and would be invaluable in testing the soundness of girders or crank axles. It has a strong analogy to the induction balance invented some

years ago by Professor Hughes of microphone fame.

In many of our manufacturing districts the streams are polluted to such an extent that they have all the appearance of being rivers of ink. It has been lately pointed out by a contemporary that in Algeria, Spain, and India, there are rivers which are not only inky in appearance, but have the same chemical composition and valuable qualities of true ink. They are produced when a stream strongly impregnated with iron combines with one flowing through a peaty district, the gallic acid in the latter forming with the iron a true ink which can be used for writing purposes.

By international agreement, the use of explosive bullets in warfare is forbidden, and the prohibition is creditable to civilisation. But the new Lebel rifle bullet—which is now the adopted weapon of the French army, and has been used lately in Dahomey—is said to inflict wounds quite as terrible as any possible by the use of explosive projectiles. The rending action on the human body is said to be truly horrible, and the penetrating power is so great that a tree of even large dimensions forms no protection for a man concealed behind its trunk. It is evident, if this be true, that one such bullet might kill three or four men if they happened to be within the line of fire.

Some years ago there was a detailed Report in one of the American papers of a man having been killed by a meteorite. The man's name was given, the exact spot where the fatality occurred was described, and the meteorite was said to have struck its victim 'just under or on the right shoulder, passing obliquely through him to just above the left hip.' The stone was described as being of about the size of a wooden water-bucket, and its composition was stated. The *Scientific American* now states that the occurrence never took place, and that the story was invented by a reporter. There is certainly nothing impossible in such an event as that described, and it is somewhat curious that a death from a meteoric stone has never been recorded.

ON LIGHTNING FIGURES.

By CHARLES TOMLINSON, F.R.S., F.C.S.

IN *Chambers's Journal* for the 16th of July last, some effects of lightning are described, from a work published in 1857 by M. Andres Poey, Director of the Observatory at Havana, entitled *On the Photographic Effects of Lightning*. The author supposed that when a person or an animal is struck by lightning, and certain marks are produced on the body, it is by the electricity photographing the image of some neighbouring object on the living surface. In addition to the cases mentioned in your article, the following may be cited. At the village of Combe Hay, near Bath, six sheep were reposing in a meadow surrounded by woods, when they were struck by lightning and killed. 'When the skins were taken from the animals, a fac-simile of a portion of the surrounding scenery was visible on the inner surface of each skin.'

Such statements as these, which were of frequent occurrence, did not fail to attract the atten-

tion of the early electricians. In 1786 MM. Bossut and Leroy made a report to the French Academy of Sciences on the subject of some singular marks found on the body of a man who had been killed by a stroke of lightning. These marks were accounted for on the supposition that the electricity in its passage through the body had forced the blood into the vessels of the skin, and thus made all the ramifications of those vessels visible at the surface. The reporters, in fact, adopted the theory of M. Besile, who had examined the case medically—namely, that the effect was due to the irruption of blood in the vessels of the skin, producing an effect like that of an injection. M. Arago adopted a similar explanation in a case which occurred in France in July 1841, when two persons standing near a poplar tree were struck by lightning, and on the breast of each were found ramified marks said to be like the leaves of the poplar.

Cases of this kind continued to be repeated in the newspapers down to the year 1862. One was given in the *Times* of September 8, as having occurred at Whalley Range, near Manchester. A boy had taken refuge under a tree, when it was struck by lightning, and there was found on the boy's body 'a perfect image of the tree, the fibres, leaves, and branches being reproduced with photographic accuracy.' The Meteorological Society and the medical papers also published such cases. One such was given in the *Lancet* in 1860, in which ramified figures were traced from the trunk down both limbs of the patient, so regular as to lead to a conclusion 'that the phenomenon must have been regulated by some fixed law.' Cases also occurred in which these ramified figures were impressed on a man's body, under circumstances in which no tree was present, as in the *Lancet* case. Hence it seemed to me probable that these marks were due to the fiery hand of the lightning itself; and it appeared likely that if I could reproduce on any given surface the form assumed by the disruptive discharge of a Leyden jar, I should have a miniature representation of the passage of a flash of lightning. With this end in view, I procured squares of common crown window glass, about four inches to the side, and steeped them in a strong solution of soap and water; and before making an experiment, a plate was taken out and wiped dry with a duster, thus leaving an exceedingly thin film of soap on the surface of the glass. A Leyden jar of about a pint capacity was charged, and the plate being held by one corner, was brought up to the knob of the jar, while one knob of the discharging rod was placed on the outer coating of the jar, and the other knob was brought opposite the knob of the jar in contact with the glass. The discharge passed over the surface of the plate and over its edge to the upper knob of the discharging rod. On breathing on the surface of the plate, a tree-like figure, consisting of trunk, branches, and spray, was beautifully made out, because, wherever the electricity touched the plate, the soapy film was burnt off, and the plate rendered chemically clean; so that the breath condensed in watery lines on those parts, and in minute globules of dew on the parts where the film still remained. On the other side of the plate there was also a figure, but it was marred

by contact with the knob of the discharging rod.

At the meeting of the British Association at Manchester in 1861, I read a paper before the Physical Section on this subject, and exhibited a number of my figures. The Astronomer-royal, Airy, was in the chair, and he said that 'any one of these figures would pass for a tree all the world over.' After the meeting he continued to examine the figures, and patting me on the back, said: 'You have settled this matter!' My colleague, Professor Miller, of King's College, on breathing on one of the plates, exclaimed: 'There's the tree capitally made out, bird's nest, and all'—referring to a little circular blot on one of the branches, which might easily be taken for a bird's nest, as in one of M. Poey's cases.

The lightning that strikes is incorrectly termed a thunderbolt; it is usually a nearly vertical, jagged, trembling line of vivid light, known as 'ribbon' or 'chain lightning.' We often have an inaccurate idea of the form of a flash of lightning from the stereotyped zigzags with which artists represent this terrible element. Jupiter's thunderbolts have as conventional a form as the French carpenter's scarf-joint, which he names 'traits de Jupiter;' but Nature does her work with more fatal precision than these zigzags would imply. The Meteorological Society of London has some hundreds of photographs of lightning discharges, impressed by the lightning itself on

the sensitive plates, and they are all of the same character as the figures produced by the discharge of a Leyden jar.

There is a very curious point connected with the main discharge—namely, a number of branches or feelers are sent out, in order to find the line of least resistance, or the easiest path for the principal discharge. Thus, we read of seamen and travellers, previous to the lightning-stroke, having the sensation of cobwebs being drawn over their faces, and hearing hissing, crackling, roaring noises, and seeing branches of electric fire. This is precisely what takes place in the case of the miniature flash of lightning produced by the Leyden jar. Should the glass plate be too thick, or its surface too good an insulator, or if the jar be not fully charged, or the electricity deficient in tension, the main discharge will not pass; but there will be a brush discharge, producing these beautiful ramifications or feelers which chalk out, as it were, the principal line of discharge. In some cases these ramifications produce a division of the discharge into two or three main lines, corresponding with the bifurcations and trifurcations which are well known in the thunder-storm, so that the same lightning stroke may strike two or even three objects at once. In such cases, each principal line is accompanied with its own ramifications, which become more delicate as they spread and more difficult to define and delineate.

Volume IX. of the Fifth Series of CHAMBERS'S JOURNAL is now completed, price Nine Shillings.

A Title-page and Index, price One Penny, have been prepared, and may be ordered through any bookseller.
